

# Package ‘cvms’

December 1, 2019

**Title** Cross-Validation for Model Selection

**Version** 0.3.2

**Description** Cross-validate one or multiple regression and classification models and get relevant evaluation metrics in a tidy format. Validate the best model on a test set and compare it to a baseline evaluation. Alternatively, evaluate predictions from an external model. Currently supports regression and classification (binary and multiclass). Described in chp. 5 of Jeyaraman, B. P., Olsen, L. R., & Wambugu M. (2019, ISBN: 9781838550134).

baseline	<i>Create baseline evaluations</i>
----------	------------------------------------

---

### Description

#### Maturing

Create a baseline evaluation of a test set.

When family is gaussian: fits baseline models ( $y \sim 1$ ) on  $n$  random subsets of `train_data` and evaluates each model on `test_data`. Also evaluates a model fitted on all rows in `train_data`.

When family is binomial: evaluates  $n$  sets of random predictions against the dependent variable, along with a set of all 0 predictions and a set of all 1 predictions.

When family is multinomial: creates one-vs-all (binomial) baseline evaluations for  $n$  sets of random predictions against the dependent variable, along with sets of "all class x,y,z,..." predictions.

**Usage**

```
baseline(
  test_data,
  dependent_col,
  train_data = NULL,
  n = 100,
  family = "binomial",
  positive = 2,
  cutoff = 0.5,
  random_generator_fn = runif,
  random_effects = NULL,
  min_training_rows = 5,
  min_training_rows_left_out = 3,
  REML = FALSE,
  parallel = FALSE
)
```

**Arguments**

test_data	Data Frame.
dependent_col	Name of dependent variable in the supplied test and training sets.
train_data	Data Frame. Only used when family == "gaussian".
n	Number of random samplings to perform. For gaussian: The number of random samplings of train_data to fit baseline models on. For binomial and multinomial: The number of sets of random predictions to evaluate.
family	Name of family. (Character) Currently supports "gaussian", "binomial" and "multinomial".
positive	Level from dependent variable to predict. Either as character or level index (1 or 2 - alphabetically). E.g. if we have the levels "cat" and "dog" and we want "dog" to be the positive class, we can either provide "dog" or 2, as alphabetically, "dog" comes after "cat". Used when calculating confusion matrix metrics and creating ROC curves. N.B. Only affects evaluation metrics, not the returned predictions. <b>N.B. Binomial only.</b> (Character or Integer)
cutoff	Threshold for predicted classes. (Numeric) N.B. <b>Binomial only</b>
random_generator_fn	Function for generating random numbers when type is "multinomial". The softmax function is applied to the generated numbers to transform them to probabilities. The first argument must be the number of random numbers to generate, as no other arguments are supplied. To test the effect of using different functions, see <a href="#">multiclass_probability_tibble</a> . N.B. <b>Multinomial only</b>

random_effects	Random effects structure for Gaussian baseline model. (Character) E.g. with "(1 ID)", the model becomes "y ~ 1 + (1 ID)". N.B. <b>Gaussian only</b>
min_training_rows	Minimum number of rows in the random subsets of train_data. <b>Gaussian only.</b> (Integer)
min_training_rows_left_out	Minimum number of rows left out of the random subsets of train_data. I.e. a subset will maximally have the size: $\text{max\_rows\_in\_subset} = \text{nrow}(\text{train\_data}) - \text{min\_training\_rows\_left\_out}$ . N.B. <b>Gaussian only.</b> (Integer)
REML	Whether to use Restricted Maximum Likelihood. (Logical) N.B. <b>Gaussian only.</b> (Integer)
parallel	Whether to run the n evaluations in parallel. (Logical) Remember to register a parallel backend first. E.g. with <code>doParallel::registerDoParallel</code> .

## Details

Packages used:

### Models:

Gaussian: `stats::lm`

### Results: Gaussian:

r2m: `MuMIn::r.squaredGLMM`

r2c: `MuMIn::r.squaredGLMM`

AIC: `stats::AIC`

AICc: `MuMIn::AICc`

BIC: `stats::BIC`

### Binomial and Multinomial:

Confusion matrix and related metrics: `caret::confusionMatrix`

ROC and related metrics: `pROC::roc`

MCC: `mltools::mcc`

## Value

List containing:

1. a tibble with summarized results (called `summarized_metrics`)
2. a tibble with random evaluations (`random_evaluations`)
3. a tibble with the summarized class level results (`summarized_class_level_results`) (**Multinomial only**)

---

### Gaussian Results:

---

The **Summarized Results** tibble contains:

Average **RMSE**, **MAE**, **r2m**, **r2c**, **AIC**, **AICc**, and **BIC**.

The **Measure** column indicates the statistical descriptor used on the evaluations. The row where Measure == All\_rows is the evaluation when the baseline model is trained on all rows in train\_data.

The **Training Rows** column contains the aggregated number of rows used from train\_data, when fitting the baseline models.

.....  
The **Random Evaluations** tibble contains:

The **non-aggregated metrics**.

A nested tibble with the **predictions** and targets.

A nested tibble with the **coefficients** of the baseline models.

Number of **training rows** used when fitting the baseline model on the training set.

Specified **family**.

Name of **dependent** variable.

Name of **fixed** effect (bias term only).

**Random** effects structure (if specified).

---

### Binomial Results:

Based on the generated test set predictions, a confusion matrix and ROC curve are used to get the following:

ROC:

**AUC, Lower CI, and Upper CI**

Confusion Matrix:

**Balanced Accuracy, F1, Sensitivity, Specificity, Positive Prediction Value, Negative Prediction Value, Kappa, Detection Rate, Detection Prevalence, Prevalence, and MCC** (Matthews correlation coefficient).

.....  
The **Summarized Results** tibble contains:

The **Measure** column indicates the statistical descriptor used on the evaluations. The row where Measure == All\_0 is the evaluation when all predictions are 0. The row where Measure == All\_1 is the evaluation when all predictions are 1.

The **aggregated metrics**.

.....  
The **Random Evaluations** tibble contains:

The **non-aggregated metrics**.

A nested tibble with the **predictions** and targets.

A nested tibble with the sensitivities and specificities from the **ROC** curve.

A nested tibble with the **confusion matrix**. The Pos\_ columns tells you whether a row is a True Positive (TP), True Negative (TN), False Positive (FP), or False Negative (FN), depending on which level is the "positive" class. I.e. the level you wish to predict.

Specified **family**.

Name of **dependent** variable.

---

## Multinomial Results:

---

Based on the generated test set predictions, one-vs-all (binomial) evaluations are performed and aggregated to get the same metrics as in the binomial results, with the addition of **Overall Accuracy** in the summarized results.

.....

The **Summarized Results** tibble contains:

Summary of the random evaluations.

**How:** First, the one-vs-all binomial evaluations are aggregated by repetition (ignoring NAs), and then, these aggregations are summarized. Besides the metrics from the binomial evaluations (see *Binomial Results* above), it also includes the **Overall Accuracy** metric.

The **Measure** column indicates the statistical descriptor used on the evaluations. The **Mean**, **Median**, **SD**, and **IQR** describe the repetition evaluations (similar to the *Random Evaluations* tibble, but ignoring NAs when aggregating, as the NAs and INFs are counted instead), while the **Max**, **Min**, **NAs**, and **INFs** are extracted from the *Summarized Class Level Results* tibble, to get the overall values. The NAs and INFs are only counted in the one-vs-all evaluations.

The rows where `Measure == All_<<class name>>` are the evaluations when all the observations are predicted to be in that class.

.....

The **Summarized Class Level Results** tibble contains:

The (nested) summarized results for each class, with the same metrics and descriptors as the *Summarized Results* tibble. Use `tidyr::unnest` on the tibble to inspect the results.

**How:** The one-vs-all evaluations are summarized by class.

The rows where `Measure == All_0` are the evaluations when none of the observations are predicted to be in that class, while the rows where `Measure == All_1` are the evaluations when all of the observations are predicted to be in that class.

.....

The **Random Evaluation** tibble contains:

The repetition results with the same metrics as the *Summarized Results* tibble.

**How:** The one-vs-all evaluations are aggregated by repetition. NA's are not ignored, meaning that any NA from a one-vs-all evaluation will lead to an NA result for that repetition.

Also includes:

A nested tibble with the one-vs-all binomial evaluations (**Class Level Results**), including nested **ROC curves** and **Confusion Matrices**, and the **Support** column, which is a count of how many observations from the class is in the test set.

A nested tibble with the **predictions** and targets.

A nested tibble with the multiclass **confusion matrix**.

Specified **family**.

Name of **dependent** variable.

          random_generator_fn = rcertain)

```

---

combine\_predictors      *Generate model formulas by combining predictors*

---

## Description

### Maturing

Create model formulas with every combination of your fixed effects, along with the dependent variable and random effects. 259,358 formulas have been precomputed with two- and three-way interactions for up to 8 fixed effects, with up to 5 included effects per formula. Uses the + and \* operators, so lower order interactions are automatically included.

## Usage

```

combine_predictors(
  dependent,
  fixed_effects,
  random_effects = NULL,
  max_fixed_effects = 5,
  max_interaction_size = 3,
  max_effect_frequency = NULL
)

```

## Arguments

dependent	Name of dependent variable. (Character)
fixed_effects	List of fixed effects. (Character)
	Max. limit of 8 effects <b>when interactions are included!</b>
	A fixed effect name cannot contain: white spaces, "*" or "+".

Effects in sublists will be interchanged. This can be useful, when we have multiple versions of a predictor (e.g.  $x_1$  and  $\log(x_1)$ ) that we do not wish to have in the same formula.

Example of interchangeable effects:

```
list( list( "x1", "log_x1" ), "x2", "x3" )
```

`random_effects` The random effects structure. (Character)

Is appended to the model formulas.

`max_fixed_effects`

Maximum number of fixed effects in a model formula. (Integer)

Max. limit of 5 **when interactions are included!**

`max_interaction_size`

Maximum number of effects in an interaction. (Integer)

Max. limit of 3.

Use this to limit the n-way interactions allowed. 0 or 1 excludes interactions all together.

A model formula can contain multiple interactions.

`max_effect_frequency`

Maximum number of times an effect is included in a formula string.

### Value

List of model formulas.

E.g.:

```
c("y ~ x1 + (1|z)", "y ~ x2 + (1|z)", "y ~ x1 + x2 + (1|z)", "y ~ x1 * x2 + (1|z)").
```

### Author(s)

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

### Examples

```
# Attach packages
library(cvms)

# Create effect names
dependent <- "y"
fixed_effects <- c("a", "b", "c")
random_effects <- "(1|e)"

# Create model formulas
combine_predictors(dependent, fixed_effects,
                  random_effects)

# Create effect names with interchangeable effects in sublists
fixed_effects <- list("a", list("b", "log_b"), "c")

# Create model formulas
combine_predictors(dependent, fixed_effects,
                  random_effects)
```

---

compatible.formula.terms

*Compatible formula terms*

---

### Description

162,660 pairs of compatible terms for building model formulas with up to 15 fixed effects.

### Format

A data frame with 162,660 rows and 5 variables:

**left** term, fixed effect or interaction, with fixed effects separated by "\*"

**right** term, fixed effect or interaction, with fixed effects separated by "\*"

**max\_interaction\_size** maximum interaction size in the two terms, up to 3

**num\_effects** number of unique fixed effects in the two terms, up to 5

**min\_num\_fixed\_effects** minimum number of fixed effects required to use a formula with the two terms, i.e. the index in the alphabet of the last of the alphabetically ordered effects (letters) in the two terms, so 4 if `left == "A"` and `right == "D"`

### Details

A term is either a fixed effect or an interaction between fixed effects (up to three-way), where the effects are separated by the "\*" operator.

Two terms are compatible if they are not redundant, meaning that both add a fixed effect to the formula. E.g. as the interaction "x1 \* x2 \* x3" expands to "x1 + x2 + x3 + x1 \* x2 + x1 \* x3 + x2 \* x3 + x1 \* x2 \* x3", the higher order interaction makes these "sub terms" redundant. Note: All terms are compatible with NA.

Effects are represented by the first fifteen capital letters.

Used to generate the model formulas for [combine\\_predictors](#).

### Author(s)

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

---

cross\_validate

*Cross-validate regression models for model selection*

---

### Description

#### Stable

Cross-validate one or multiple gaussian or binomial models at once. Perform repeated cross-validation. Returns results in a tibble for easy comparison, reporting and further analysis.

See [cross\\_validate\\_fn\(\)](#) for use with custom model functions.

**Usage**

```

cross_validate(
  data,
  models,
  fold_cols = ".folds",
  family = "gaussian",
  link = NULL,
  control = NULL,
  REML = FALSE,
  cutoff = 0.5,
  positive = 2,
  metrics = list(),
  rm_nc = FALSE,
  parallel = FALSE,
  model_verbose = FALSE
)

```

**Arguments**

data	Data frame. Must include grouping factor for identifying folds - as made with <code>groupdata2::fold()</code> .
models	Model formulas as strings. (Character) E.g. <code>c("y~x", "y~z")</code> . Can contain random effects. E.g. <code>c("y~x+(1 r)", "y~z+(1 r)")</code> .
fold_cols	Name(s) of grouping factor(s) for identifying folds. (Character) Include names of multiple grouping factors for repeated cross-validation.
family	Name of family. (Character) Currently supports "gaussian" and "binomial".
link	Link function. (Character) E.g. <code>link = "log"</code> with <code>family = "gaussian"</code> will use <code>family = gaussian(link = "log")</code> . See <code>stats::family</code> for available link functions. <b>Default link functions:</b> Gaussian: 'identity'. Binomial: 'logit'.
control	Construct control structures for mixed model fitting (i.e. <code>lmer</code> and <code>glmer</code> ). See <code>lme4::lmerControl</code> and <code>lme4::glmerControl</code> . N.B. Ignored if fitting <code>lm</code> or <code>glm</code> models.
REML	Restricted Maximum Likelihood. (Logical)
cutoff	Threshold for predicted classes. (Numeric) N.B. <b>Binomial models only</b>
positive	Level from dependent variable to predict. Either as character or level index (1 or 2 - alphabetically). E.g. if we have the levels "cat" and "dog" and we want "dog" to be the positive class, we can either provide "dog" or 2, as alphabetically, "dog" comes after "cat".

	Used when calculating confusion matrix metrics and creating ROC curves. N.B. Only affects evaluation metrics, not the model training or returned predictions. N.B. <b>Binomial models only</b> .
metrics	List for enabling/disabling metrics. E.g. <code>list("RMSE" = FALSE)</code> would remove RMSE from the results, and <code>list("Accuracy" = TRUE)</code> would add the regular accuracy metric to the classification results. Default values (TRUE/FALSE) will be used for the remaining metrics available. Also accepts the string "all". N.B. Currently, disabled metrics are still computed.
rm_nc	Remove non-converged models from output. (Logical)
parallel	Whether to cross-validate the list of models in parallel. (Logical) Remember to register a parallel backend first. E.g. with <code>doParallel::registerDoParallel</code> .
model_verbos	Message name of used model function on each iteration. (Logical)

## Details

Packages used:

### Models:

Gaussian: `stats::lm`, `lme4::lmer`

Binomial: `stats::glm`, `lme4::glmer`

### Results:

*Gaussian:*

r2m : `MuMIn::r.squaredGLMM`

r2c : `MuMIn::r.squaredGLMM`

AIC : `stats::AIC`

AICc : `MuMIn::AICc`

BIC : `stats::BIC`

*Binomial:*

Confusion matrix: `caret::confusionMatrix`

ROC: `pROC::roc`

MCC: `mltools::mcc`

## Value

Tbl (tibble) with results for each model.

**Shared across families:** A nested tibble with **coefficients** of the models from all iterations.

Number of *total folds*.

Number of **fold columns**.

Count of **convergence warnings**. Consider discarding models that did not converge on all iterations. Note: you might still see results, but these should be taken with a grain of salt!

Count of **other warnings**. These are warnings without keywords such as "convergence".

Count of **Singular Fit messages**. See `?lme4::isSingular` for more information.

Nested tibble with the **warnings and messages** caught for each model.

Specified **family**.

Specified **link** function.

Name of **dependent** variable.  
 Names of **fixed** effects.  
 Names of **random** effects, if any.

---

### Gaussian Results:

---

Average **RMSE**, **MAE**, **r2m**, **r2c**, **AIC**, **AICc**, and **BIC** of all the iterations\*, **omitting potential NAs from non-converged iterations**. Note that the Information Criteria metrics (AIC, AICc, and BIC) are also averages.

A nested tibble with the **predictions** and targets.

A nested tibble with the non-averaged **results** from all iterations.

\* In *repeated cross-validation*, the metrics are first averaged for each fold column (repetition) and then averaged again.

---

### Binomial Results:

---

Based on the **collected** predictions from the test folds\*, a confusion matrix and a ROC curve are created to get the following:

ROC:

**AUC**, **Lower CI**, and **Upper CI**

Confusion Matrix:

**Balanced Accuracy**, **F1**, **Sensitivity**, **Specificity**, **Positive Prediction Value**, **Negative Prediction Value**, **Kappa**, **Detection Rate**, **Detection Prevalence**, **Prevalence**, and **MCC** (Matthews correlation coefficient).

Other available metrics (disabled by default, see `metrics`): **Accuracy**.

Also includes:

A nested tibble with **predictions**, predicted classes (depends on cutoff), and the targets. Note, that the **predictions are not necessarily of the specified positive class**, but of the model's positive class (second level of dependent variable, alphabetically).

A nested tibble with the sensitivities and specificities from the **ROC** curve(s).

A nested tibble with the **confusion matrix**/matrices. The `Pos_` columns tells you whether a row is a True Positive (TP), True Negative (TN), False Positive (FP), or False Negative (FN), depending on which level is the "positive" class. I.e. the level you wish to predict.

A nested tibble with the **results** from all fold columns, when using *repeated cross-validation*.

\* In *repeated cross-validation*, an evaluation is made per fold column (repetition) and averaged.

              REML = FALSE)

# Use non-default link functions

cross_validate(data,
              models = "score~diagnosis",
              family = 'gaussian',
              link = 'log',
              REML = FALSE)

# Use parallelization

# Attach doParallel and register four cores
# Uncomment:
# library(doParallel)
```

```
# registerDoParallel(4)

# Create list of 20 model formulas
models <- rep(c("score~diagnosis+(1|session)",
              "score~age+(1|session)"), 10)

# Cross-validate a list of 20 model formulas in parallel
system.time({cross_validate(data,
                          models = models,
                          family = 'gaussian',
                          parallel = TRUE)})

# Cross-validate a list of 20 model formulas sequentially
system.time({cross_validate(data,
                          models = models,
                          family = 'gaussian',
                          parallel = FALSE)})
```

---

cross\_validate\_fn      *Cross-validate custom model functions for model selection*

---

## Description

### Experimental

Cross-validate your model function with one or multiple model formulas at once. Perform repeated cross-validation. Returns results in a tibble for easy comparison, reporting and further analysis.

Compared to `cross_validate()`, this function allows you supply a custom model function and (if needed) a custom predict function.

Supports regression and classification (binary and multiclass). See `type`.

Note that some metrics may not be computable for all types of model objects.

## Usage

```
cross_validate_fn(
  data,
  model_fn,
  formulas,
  fold_cols = ".folds",
  type = "gaussian",
  cutoff = 0.5,
  positive = 2,
  predict_type = NULL,
  predict_fn = NULL,
  metrics = list(),
  rm_nc = FALSE,
  parallel = FALSE
)
```

**Arguments**

data	Data frame. Must include grouping factor for identifying folds - as made with <code>groupdata2::fold()</code> .
model_fn	Model function that returns a fitted model object. Will usually wrap an existing model function like <code>e1071::svm</code> or <code>nnet::multinom</code> . Must have the following function arguments: <code>function(train_data, formula)</code>
formulas	Model formulas as strings. (Character) Will be converted to <code>formula</code> objects before being passed to <code>model_fn</code> . E.g. <code>c("y~x", "y~z")</code> . Can contain random effects. E.g. <code>c("y~x+(1 r)", "y~z+(1 r)")</code> .
fold_cols	Name(s) of grouping factor(s) for identifying folds. (Character) Include names of multiple grouping factors for repeated cross-validation.
type	Type of evaluation to perform: "gaussian" for regression (like linear regression). "binomial" for binary classification. "multinomial" for multiclass classification.
cutoff	Threshold for predicted classes. (Numeric) N.B. <b>Binomial models only</b>
positive	Level from dependent variable to predict. Either as character or level index (1 or 2 - alphabetically). E.g. if we have the levels "cat" and "dog" and we want "dog" to be the positive class, we can either provide "dog" or 2, as alphabetically, "dog" comes after "cat". Used when calculating confusion matrix metrics and creating ROC curves. N.B. Only affects evaluation metrics, not the model training or returned predictions. N.B. <b>Binomial models only</b> .
predict_type	The type argument for <code>predict()</code> . When the defaults fail, provide it such that the <code>predict()</code> output is as follows: <b>Binomial:</b> Vector or one-column matrix / data frame with probabilities (0-1). E.g.: <code>c(0.3, 0.5, 0.1, 0.5)</code> <b>Gaussian:</b> Vector or one-column matrix / data frame with the predicted value. E.g.: <code>c(3.7, 0.9, 1.2, 7.3)</code> <b>Multinomial:</b> Data frame with one column per class containing probabilities of the class. Column names should be identical to how the class names are written in the target column. E.g.:

class_1	class_2	class_3
0.269	0.528	0.203
0.368	0.322	0.310
0.375	0.371	0.254
...	...	...

	N.B. predict_fn and predict_type are mutually exclusive. Specify only one of them.
predict_fn	Function for predicting the targets in the test folds using the fitted model object. Will usually wrap <code>predict()</code> , but doesn't have to. Must return predictions in the format described in predict_type above. Must have the following function arguments: <code>function(test_data, model, formula = NULL)</code> N.B. predict_fn and predict_type are mutually exclusive. Specify only one of them.
metrics	List for enabling/disabling metrics. E.g. <code>list("RMSE" = FALSE)</code> would remove RMSE from the results, and <code>list("Accuracy" = TRUE)</code> would add the regular accuracy metric to the classification results. Default values (TRUE/FALSE) will be used for the remaining metrics available. Also accepts the string "all". N.B. Currently, disabled metrics are still computed.
rm_nc	Remove non-converged models from output. (Logical)
parallel	Whether to cross-validate the list of models in parallel. (Logical) Remember to register a parallel backend first. E.g. with <code>doParallel::registerDoParallel</code> .

## Details

Packages used:

### Results:

*Gaussian:*

r2m : `MuMIn::r.squaredGLMM`

r2c : `MuMIn::r.squaredGLMM`

AIC : `stats::AIC`

AICc : `MuMIn::AICc`

BIC : `stats::BIC`

*Binomial:*

Confusion matrix: `caret::confusionMatrix`

ROC: `pROC::roc`

MCC: `mltools::mcc`

## Value

Tbl (tibble) with results for each model.

**Shared across families:** A nested tibble with **coefficients** of the models from all iterations. The coefficients are extracted from the model object with `broom::tidy()` or `coef()` (with some restrictions on the output). If these attempts fail, a default coefficients tibble filled with NAs is returned.

Number of *total folds*.

Number of **fold columns**.

Count of **convergence warnings**, using a limited set of keywords (e.g. "convergence"). If a convergence warning does not contain one of these keywords, it will be counted with **other warnings**. Consider discarding models that did not converge on all iterations. Note: you might still see results, but these should be taken with a grain of salt!

Nested tibble with the **warnings and messages** caught for each model.

Specified **family**.  
 Name of **dependent** variable.  
 Names of **fixed** effects.  
 Names of **random** effects, if any.

---

### Gaussian Results:

---

Average **RMSE**, **MAE**, **r2m**, **r2c**, **AIC**, **AICc**, and **BIC** of all the iterations\*, **omitting potential NAs from non-converged iterations**. Some metrics will return NA if they can't be extracted from the fitted model objects.

N.B. The Information Criteria metrics (AIC, AICc, and BIC) are also averages.

A nested tibble with the **predictions** and targets.

A nested tibble with the non-averaged **results** from all iterations.

\* In *repeated cross-validation*, the metrics are first averaged for each fold column (repetition) and then averaged again.

---

### Binomial Results:

---

Based on the **collected** predictions from the test folds\*, a confusion matrix and a ROC curve are created to get the following:

ROC:

**AUC**, **Lower CI**, and **Upper CI**

Confusion Matrix:

**Balanced Accuracy**, **F1**, **Sensitivity**, **Specificity**, **Positive Prediction Value**, **Negative Prediction Value**, **Kappa**, **Detection Rate**, **Detection Prevalence**, **Prevalence**, and **MCC** (Matthews correlation coefficient).

Other available metrics (disabled by default, see **metrics**): **Accuracy**.

Also includes:

A nested tibble with the **predictions**, predicted classes (depends on cutoff), and targets. Note, that the **predictions are not necessarily of the specified positive class**, but of the model's positive class (second level of dependent variable, alphabetically).

A nested tibble with the sensitivities and specificities from the **ROC** curves.

A nested tibble with the **confusion matrix**/matrices. The Pos\_ columns tells you whether a row is a True Positive (TP), True Negative (TN), False Positive (FP), or False Negative (FN), depending on which level is the "positive" class. I.e. the level you wish to predict.

A nested tibble with the **results** from all fold columns, when using *repeated cross-validation*.

\* In *repeated cross-validation*, an evaluation is made per fold column (repetition) and averaged.

---

### Multinomial Results:

---

For each class, a *one-vs-all* binomial evaluation is performed. This creates a **class level results** tibble containing the same metrics as the binomial results described above, along with the **Support** metric, which is simply a count of the class in the target column. These metrics are used to calculate the macro metrics in the output tibble. The nested class level results tibble is also

included in the output tibble, and would usually be reported along with the macro and overall metrics.

The output tibble contains the macro and overall metrics. The metrics that share their name with the metrics in the nested class level results tibble are averages of those metrics (note: does not remove NAs before averaging). In addition to these, it also includes the **Overall Accuracy** metric. Other available metrics (disabled by default, see `metrics`): **Accuracy**, **Weighted Balanced Accuracy**, **Weighted Accuracy**, **Weighted F1**, **Weighted Sensitivity**, **Weighted Specificity**, **Weighted Pos Pred Value**, **Weighted Neg Pred Value**, **Weighted AUC**, **Weighted Lower CI**, **Weighted Upper CI**, **Weighted Kappa**, **Weighted MCC**, **Weighted Detection Rate**, **Weighted Detection Prevalence**, and **Weighted Prevalence**.

Note that the "Weighted" metrics are weighted averages, weighted by the Support.

Also includes:

A nested tibble with the **predictions**, predicted classes, and targets.

A nested tibble with the multiclass **Confusion Matrix**.

### Class Level Results

The nested class level results tibble also includes:

A nested tibble with the sensitivities and specificities from the **ROC** curve.

A nested tibble with the **confusion matrix** from the one-vs-all evaluation. The `Pos_` columns tells you whether a row is a True Positive (TP), True Negative (TN), False Positive (FP), or False Negative (FN), depending on which level is the "positive" class. In our case, 1 is the current class and 0 represents all the other classes together.

```

**Description**

Perform (repeated) cross-validation on a list of model formulas. Validate the best model on a validation set. Perform baseline evaluations on your test set. Generate model formulas by combining your fixed effects. Evaluate predictions from an external model.

**Details**

Returns results in a tibble for easy comparison, reporting and further analysis.

The `cvms` package provides 5 main functions: `cross_validate`, `cross_validate_fn`, `validate`, `baseline`, and `evaluate`.

And a couple of helper functions: `combine_predictors`, `select_metrics`, `reconstruct_formulas`, `cv_plot`.

**Author(s)**

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

---

cv\_plot

*Wrapper for plotting common plots using ggplot2*

---

**Description****Experimental**

Creates various plots based on the output of `cvms::cross_validate()`

**Usage**

```
cv_plot(x, type)
```

**Arguments**

`x` Object returned by `cvms::cross_validate()` (tbl)

`type` Type of plot.

**Gaussian:**

'RMSE' - boxplot

'r2' - boxplot

'IC' - boxplot

'coefficients' - boxplot

**Binomial:**

"ROC" - ROC curve

**Author(s)**

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

## Examples

```
# Attach packages
library(cvms)
library(groupdata2) # fold()

# Load data (included in cvms)
data <- participant.scores

# Fold data
data <- fold(data, k = 4,
             cat_col = 'diagnosis',
             id_col = 'participant')

# Cross-validate a gaussian model
CVgauss <- cross_validate(data,
                          "score~diagnosis",
                          family='gaussian')

# Plot results for gaussian model
cv_plot(CVgauss, type = 'RMSE')
cv_plot(CVgauss, type = 'r2')
cv_plot(CVgauss, type = 'IC')
cv_plot(CVgauss, type = 'coefficients')

# Cross-validate a binomial model
CVbinom <- cross_validate(data,
                          "diagnosis~score",
                          family='binomial')

# Plot results for binomial model
cv_plot(CVbinom, type = 'ROC')
```

---

evaluate

*Evaluate your model's performance*

---

## Description

### Maturing

Evaluate your model's predictions on a set of evaluation metrics.

Create ID-aggregated evaluations by multiple methods.

Currently supports regression and classification (binary and multiclass). See type.

## Usage

```
evaluate(
  data,
  target_col,
  prediction_cols,
  type = "gaussian",
  id_col = NULL,
```

```

id_method = "mean",
models = NULL,
apply_softmax = TRUE,
cutoff = 0.5,
positive = 2,
metrics = list(),
include_predictions = TRUE,
parallel = FALSE
)

```

## Arguments

**data** Data frame with predictions, targets and (optionally) an ID column. Can be grouped with `group_by`.

**Multinomial:** When type is "multinomial", the predictions should be passed as one column per class with the probability of that class. The columns should have the name of their class, as they are named in the target column. E.g.:

class_1	class_2	class_3	target
0.269	0.528	0.203	class_2
0.368	0.322	0.310	class_3
0.375	0.371	0.254	class_2
...	...	...	...

**Binomial:** When type is "binomial", the predictions should be passed as one column with the probability of class being the second class alphabetically (1 if classes are 0 and 1). E.g.:

prediction	target
0.769	1
0.368	1
0.375	0
...	...

**Gaussian:** When type is "gaussian", the predictions should be passed as one column with the predicted values. E.g.:

prediction	target
28.9	30.2
33.2	27.1
23.4	21.3
...	...

**target\_col** Name of the column with the true classes/values in data. When type is "multinomial", this column should contain the class names, not their indices.

**prediction\_cols** Name(s) of column(s) with the predictions. When evaluating a classification task, the column(s) should contain the predicted probabilities.

**type** Type of evaluation to perform:

	<p>"gaussian" for regression (like linear regression).</p> <p>"binomial" for binary classification.</p> <p>"multinomial" for multiclass classification.</p>
id_col	<p>Name of ID column to aggregate predictions by.</p> <p>N.B. Current methods assume that the target class/value is constant within the IDs.</p> <p>N.B. When aggregating by ID, some metrics (such as those from model objects) are excluded.</p>
id_method	<p>Method to use when aggregating predictions by ID. Either "mean" or "majority". When type is gaussian, only the "mean" method is available.</p> <p><b>mean:</b> The average prediction (value or probability) is calculated per ID and evaluated. This method assumes that the target class/value is constant within the IDs.</p> <p><b>majority:</b> The most predicted class per ID is found and evaluated. In case of a tie, the winning classes share the probability (e.g. <math>P = 0.5</math> each when two majority classes). This method assumes that the target class/value is constant within the IDs.</p>
models	<p>Unnamed list of fitted model(s) for calculating <math>R^2</math> metrics and information criterion metrics. May only work for some types of models.</p> <p>When only passing one model, remember to pass it in a list (e.g. <code>list(m)</code>).</p> <p>N.B. When data is grouped, provide one model per group in the same order as the groups.</p> <p>N.B. When aggregating by ID (i.e. when <code>id_col</code> is not NULL), it's not currently possible to pass model objects, as these would not be aggregated by the IDs.</p> <p>N.B. Currently, <b>Gaussian only</b>.</p>
apply_softmax	<p>Whether to apply the softmax function to the prediction columns when type is "multinomial".</p> <p>N.B. <b>Multinomial models only</b>.</p>
cutoff	<p>Threshold for predicted classes. (Numeric)</p> <p>N.B. <b>Binomial models only</b>.</p>
positive	<p>Level from dependent variable to predict. Either as character or level index (1 or 2 - alphabetically).</p> <p>E.g. if we have the levels "cat" and "dog" and we want "dog" to be the positive class, we can either provide "dog" or 2, as alphabetically, "dog" comes after "cat".</p> <p>Used when calculating confusion matrix metrics and creating ROC curves.</p> <p>N.B. Only affects the evaluation metrics.</p> <p>N.B. <b>Binomial models only</b>.</p>
metrics	<p>List for enabling/disabling metrics.</p> <p>E.g. <code>list("RMSE" = FALSE)</code> would remove RMSE from the results, and <code>list("Accuracy" = TRUE)</code> would add the regular accuracy metric to the classification results. Default values (TRUE/FALSE) will be used for the remaining metrics available.</p> <p>Also accepts the string "all".</p> <p>N.B. Currently, disabled metrics are still computed.</p>
include_predictions	<p>Whether to include the predictions in the output as a nested tibble. (Logical)</p>
parallel	<p>Whether to run evaluations in parallel, when data is grouped with <code>group_by</code>.</p>

## Details

Packages used:

### Gaussian:

r2m : MuMIn::r.squaredGLMM

r2c : MuMIn::r.squaredGLMM

AIC : stats::AIC

AICc : MuMIn::AICc

BIC : stats::BIC

### Binomial and Multinomial:

Confusion matrix and related metrics: caret::confusionMatrix

ROC and related metrics: pROC::roc

MCC: mltools::mcc

## Value

---

### Gaussian Results:

Tibble containing the following metrics by default:

Average **RMSE**, **MAE**, **r2m**, **r2c**, **AIC**, **AICc**, and **BIC**.

N.B. Some of the metrics will only be returned if model objects were passed, and will be NA if they could not be extracted from the passed model objects.

Also includes:

A nested tibble with the **Predictions** and targets.

A nested tibble with the model **Coefficients**. The coefficients are extracted from the model object with `broom::tidy()` or `coef()` (with some restrictions on the output). If these attempts fail, a default coefficients tibble filled with NAs is returned.

---

### Binomial Results:

Tibble with the following evaluation metrics, based on a confusion matrix and a ROC curve fitted to the predictions:

ROC:

**AUC**, **Lower CI**, and **Upper CI**

Confusion Matrix:

**Balanced Accuracy**, **F1**, **Sensitivity**, **Specificity**, **Positive Prediction Value**, **Negative Prediction Value**, **Kappa**, **Detection Rate**, **Detection Prevalence**, **Prevalence**, and **MCC** (Matthews correlation coefficient).

Other available metrics (disabled by default, see `metrics`): **Accuracy**.

Also includes:

A nested tibble with the **predictions** and targets.

A nested tibble with the sensitivities and specificities from the **ROC** curve.

A nested tibble with the **confusion matrix**. The `Pos_` columns tells you whether a row is a True Positive (TP), True Negative (TN), False Positive (FP), or False Negative (FN), depending on which level is the "positive" class. I.e. the level you wish to predict.

---

### Multinomial Results:

---

For each class, a *one-vs-all* binomial evaluation is performed. This creates a **Class Level Results** tibble containing the same metrics as the binomial results described above, along with the **Support** metric, which is simply a count of the class in the target column. These metrics are used to calculate the macro metrics in the output tibble. The nested class level results tibble is also included in the output tibble, and would usually be reported along with the macro and overall metrics.

The output tibble contains the macro and overall metrics. The metrics that share their name with the metrics in the nested class level results tibble are averages of those metrics (note: does not remove NAs before averaging). In addition to these, it also includes the **Overall Accuracy** metric.

Other available metrics (disabled by default, see `metrics`): **Accuracy**, **Weighted Balanced Accuracy**, **Weighted Accuracy**, **Weighted F1**, **Weighted Sensitivity**, **Weighted Specificity**, **Weighted Pos Pred Value**, **Weighted Neg Pred Value**, **Weighted AUC**, **Weighted Lower CI**, **Weighted Upper CI**, **Weighted Kappa**, **Weighted MCC**, **Weighted Detection Rate**, **Weighted Detection Prevalence**, and **Weighted Prevalence**.

Note that the "Weighted" metrics are weighted averages, weighted by the Support.

Also includes:

A nested tibble with the **Predictions** and targets.

A nested tibble with the multiclass **Confusion Matrix**.

### Class Level Results

Besides the binomial evaluation metrics and the Support metric, the nested class level results tibble also contains:

A nested tibble with the sensitivities and specificities from the **ROC** curve.

A nested tibble with the **Confusion Matrix** from the one-vs-all evaluation. The `Pos_` columns tells you whether a row is a True Positive (TP), True Negative (TN), False Positive (FP), or False Negative (FN), depending on which level is the "positive" class. In our case, 1 is the current class and 0 represents all the other classes together.

# Train multinomial model using the nnet package
mn_model <- nnet::multinom(
  "class ~ predictor_1 + predictor_2 + predictor_3",
  data = data_for_nnet)

# Predict the targets in the dataset
# (we would usually use a test set instead)
predictions <- predict(mn_model, data_for_nnet,
  type = "probs") %>%
  dplyr::as_tibble()

# Add the targets
predictions[["target"]] <- data_for_nnet[["class"]]

# Evaluate predictions
evaluate(data = predictions, target_col = "target",
  prediction_cols = class_names,
  type = "multinomial")

```

---

multiclass\_probability\_tibble

*Generate a multiclass probability tibble*

---

## Description

### Maturing

Generate a tibble with random numbers containing one column per specified class. When the softmax function is applied, the numbers become probabilities that sum to 1 rowwise.

### Usage

```
multiclass_probability_tibble(
  num_classes,
  num_observations,
  apply_softmax = TRUE,
  FUN = runif,
  class_name = "class_"
)
```

### Arguments

<code>num_classes</code>	The number of classes. Also the number of columns in the tibble.
<code>num_observations</code>	The number of observations. Also the number of rows in the tibble.
<code>apply_softmax</code>	Whether to apply the softmax function rowwise. This will transform the numbers to probabilities that sum to 1 rowwise.
<code>FUN</code>	Function for generating random numbers. The first argument must be the number of random numbers to generate, as no other arguments are supplied.
<code>class_name</code>	The prefix for the column names. The column index is appended.

### Author(s)

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

### Examples

```
# Attach cvms
library(cvms)

# Create a tibble with 5 classes and 10 observations
# Apply softmax to make sure the probabilities sum to 1
multiclass_probability_tibble(num_classes = 5,
                              num_observations = 10,
                              apply_softmax = TRUE)

# Using the rnorm function to generate the random numbers
multiclass_probability_tibble(num_classes = 5,
                              num_observations = 10,
                              apply_softmax = TRUE,
                              FUN = rnorm)

# Creating a custom generator function that
# exponentiates the numbers to create more "certain" predictions
rcertain <- function(n){
  (runif(n, min = 1, max = 100)^1.4)/100
}
multiclass_probability_tibble(num_classes = 5,
                              num_observations = 10,
                              apply_softmax = TRUE,
                              FUN = rcertain)
```

---

participant.scores     *Participant scores*

---

### Description

Made-up experiment data with 10 participants and two diagnoses. Test scores for 3 sessions per participant, where participants improve their scores each session.

### Format

A data frame with 30 rows and 5 variables:

**participant** participant identifier, 10 levels  
**age** age of the participant, in years  
**diagnosis** diagnosis of the participant, either 1 or 0  
**score** test score of the participant, on a 0-100 scale  
**session** testing session identifier, 1 to 3

### Author(s)

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

---

precomputed.formulas     *Precomputed formulas*

---

### Description

Fixed effect combinations for model formulas with/without two- and three-way interactions. Up to eight fixed effects in total with up to five fixed effects per formula.

### Format

A data frame with 259,358 rows and 5 variables:

**formula\_** combination of fixed effects, separated by "+" and "\*"  
**max\_interaction\_size** maximum interaction size in the formula, up to 3  
**max\_effect\_frequency** maximum count of an effect in the formula, e.g. the 3 A's in "A \* B + A \* C + A \* D"  
**num\_effects** number of unique effects included in the formula  
**min\_num\_fixed\_effects** minimum number of fixed effects required to use the formula, i.e. the index in the alphabet of the last of the alphabetically ordered effects (letters) in the formula, so 4 for the formula: "A + B + D"

### Details

Effects are represented by the first eight capital letters.

Used by [combine\\_predictors](#).

### Author(s)

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

---

reconstruct\_formulas *Reconstruct model formulas from results tibbles*

---

### Description

#### Maturing

In the results tibble from `cross_validate` and `validate`, the model formulas have been split into the columns `Dependent`, `Fixed` and `Random`. Quickly reconstruct the model formulas from these columns.

### Usage

```
reconstruct_formulas(results, topn = NULL)
```

### Arguments

results	Data frame with results from <code>cross_validate()</code> or <code>validate()</code> . (tbl) Must contain at least the columns "Dependent" and "Fixed". For random effects the "Random" column should be included.
topn	Number of top rows to return. Simply applies <code>head()</code> to the results tibble.

### Value

List of model formulas.

### Author(s)

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

---

select\_metrics *Select columns with evaluation metrics and model definitions.*

---

### Description

#### Maturing

When reporting results, we might not want all the nested tibbles and process information columns. This function selects the evaluation metrics and model formulas only.

### Usage

```
select_metrics(results, include_definitions = TRUE, additional_includes = NULL)
```

### Arguments

results	Results tibble from <code>cross_validate()</code> or <code>validate()</code> .
include_definitions	Whether to include the <code>Dependent</code> , <code>Fixed</code> and (possibly) <code>Random</code> columns. (Logical)
additional_includes	Names of additional columns to select. (Character)

**Details**

The first element in the Family column is used to identify the relevant columns.

**Value**

The results tibble with only metric and model definition columns.

**Author(s)**

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

---

validate	<i>Validate regression models on a test set</i>
----------	---

---

**Description****Stable**

Train gaussian or binomial models on a full training set and validate it by predicting the test/validation set. Returns results in a tibble for easy reporting, along with the trained models.

**Usage**

```
validate(
  train_data,
  models,
  test_data = NULL,
  partitions_col = ".partitions",
  family = "gaussian",
  link = NULL,
  control = NULL,
  REML = FALSE,
  cutoff = 0.5,
  positive = 2,
  metrics = list(),
  err_nc = FALSE,
  rm_nc = FALSE,
  parallel = FALSE,
  model_verbose = FALSE
)
```

**Arguments**

train_data	Data Frame.
models	Model formulas as strings. (Character) E.g. c("y~x", "y~z"). Can contain random effects. E.g. c("y~x+(1 r)", "y~z+(1 r)").
test_data	Data Frame. If specifying partitions_col, this can be NULL.

partitions_col	Name of grouping factor for identifying partitions. (Character) Rows with the value 1 in partitions_col are used as training set and rows with the value 2 are used as test set. N.B. Only used if test_data is NULL.
family	Name of family. (Character) Currently supports "gaussian" and "binomial".
link	Link function. (Character) E.g. link = "log" with family = "gaussian" will use family = gaussian(link = "log"). See <code>stats::family</code> for available link functions.  <b>Default link functions:</b> Gaussian: 'identity'. Binomial: 'logit'.
control	Construct control structures for mixed model fitting (i.e. <code>lmer</code> and <code>glmer</code> ). See <code>lme4::lmerControl</code> and <code>lme4::glmerControl</code> . N.B. Ignored if fitting <code>lm</code> or <code>glm</code> models.
REML	Restricted Maximum Likelihood. (Logical)
cutoff	Threshold for predicted classes. (Numeric) N.B. <b>Binomial models only</b>
positive	Level from dependent variable to predict. Either as character or level index (1 or 2 - alphabetically). E.g. if we have the levels "cat" and "dog" and we want "dog" to be the positive class, we can either provide "dog" or 2, as alphabetically, "dog" comes after "cat". Used when calculating confusion matrix metrics and creating ROC curves. N.B. Only affects evaluation metrics, not the model training or returned predictions. N.B. <b>Binomial models only.</b>
metrics	List for enabling/disabling metrics. E.g. <code>list("RMSE" = FALSE)</code> would remove RMSE from the results, and <code>list("Accuracy" = TRUE)</code> would add the regular accuracy metric to the classification results. Default values (TRUE/FALSE) will be used for the remaining metrics available. Also accepts the string "all". N.B. Currently, disabled metrics are still computed.
err_nc	Raise error if model does not converge. (Logical)
rm_nc	Remove non-converged models from output. (Logical)
parallel	Whether to validate the list of models in parallel. (Logical) Remember to register a parallel backend first. E.g. with <code>doParallel::registerDoParallel</code> .
model_verbos	Message name of used model function on each iteration. (Logical)

## Details

Packages used:

### Models:

Gaussian: `stats::lm`, `lme4::lmer`

Binomial: `stats::glm`, `lme4::glmer`

**Results: Gaussian:**r2m : `MuMIn::r.squaredGLMM`r2c : `MuMIn::r.squaredGLMM`AIC : `stats::AIC`AICc : `MuMIn::AICc`BIC : `stats::BIC`**Binomial:**Confusion matrix: `caret::confusionMatrix`ROC: `pROC::roc`MCC: `mltools::mcc`**Value**

List containing tibble (tbl) with results and the trained model object. The tibble contains:

**Shared across families:**

A nested tibble with **coefficients** of the models from all iterations.

Count of **convergence warnings**. Consider discarding models that did not converge on all iterations. Note: you might still see results, but these should be taken with a grain of salt!

Count of **other warnings**. These are warnings without keywords such as "convergence".

Count of **Singular Fit messages**. See `?lme4::isSingular` for more information.

Nested tibble with the **warnings and messages** caught for each model.

Specified **family**.

Specified **link** function.

Name of **dependent** variable.

Names of **fixed** effects.

Names of **random** effects, if any.

---

**Gaussian Results:**

---

**RMSE, MAE, r2m, r2c, AIC, AICc, and BIC.**

A nested tibble with the **predictions** and targets.

---

---

**Binomial Results:**

---

Based on predictions of the test set, a confusion matrix and ROC curve are used to get the following:

ROC:

**AUC, Lower CI, and Upper CI**

Confusion Matrix:

**Balanced Accuracy, F1, Sensitivity, Specificity, Positive Prediction Value, Negative Prediction Value, Kappa, Detection Rate, Detection Prevalence, Prevalence, and MCC** (Matthews correlation coefficient).

Other available metrics (disabled by default, see `metrics`): **Accuracy**.

Also includes:

A tibble with **predictions**, predicted classes (depends on cutoff), and the targets.

A tibble with the sensitivities and specificities from the **ROC** curve.

**Examples**

```
# Attach packages
library(cvms)
library(groupdata2) # partition()
library(dplyr) # %>% arrange()

# Data is part of cvms
data <- participant.scores

# Set seed for reproducibility
set.seed(7)

# Partition data
# Keep as single data frame
# We could also have fed validate() separate train and test sets.
data_partitioned <- partition(data,
                              p = 0.7,
                              cat_col = 'diagnosis',
                              id_col = 'participant',
                              list_out=FALSE) %>%
  arrange(.partitions)

# Validate a model

# Gaussian
validate(data_partitioned,
         models = "score~diagnosis",
         partitions_col = '.partitions',
         family='gaussian',
         REML = FALSE)

# Binomial
validate(data_partitioned,
         models = "diagnosis~score",
         partitions_col = '.partitions',
         family='binomial')

# Use non-default link functions

validate(data_partitioned,
         models = "score~diagnosis",
         partitions_col = '.partitions',
         family = 'gaussian',
         link = 'log',
         REML = FALSE)

## Feed separate train and test sets
```

```
# Partition data to list of data frames
# The first data frame will be train (70% of the data)
# The second will be test (30% of the data)
data_partitioned <- partition(data, p = 0.7,
                              cat_col = 'diagnosis',
                              id_col = 'participant',
                              list_out=TRUE)
train_data <- data_partitioned[[1]]
test_data <- data_partitioned[[2]]

# Validate a model

# Gaussian
validate(train_data,
         test_data = test_data,
         models = "score~diagnosis",
         family='gaussian',
         REML = FALSE)
```
