Timings of common tasks using the **data.table** package in R

    * WORK IN PROGRESS *

This document contains a series of tests, followed by a summary table of various timings and comparisons. Please go straight to the summary table first <here> in which each row has a link back to the test.

This document is reproducible. Simply run the .Rnw file yourself in your environment to confirm the results. Also see ?vignette, which says that edit(vignette("datatable-timings")) will extract the code from this document so you can easily work with it.

The .Rnw included in the package has N=10,000,000. This is a small number so that 'R CMD build' completes in a reasonable time (about 5 minutes). We don't want the nightly builds on R-Forge and CRAN to slow down just to run long timing comparisons. We have increased this to N=100,000,000 ourselves, and included the output on the datatable homepage (<link>).

1.1   Extraction

This is a repeat of the test in section 1 of the Introduction vignette. The syntax is explained there. This demonstrates the large difference in speed between vector scans and binary search. Therefore, please avoid using `==` in the `i` expression.

```
> n = ceiling(1e7/26^2)   # 10 million rows
> DF = data.frame(x=rep(LETTERS,each=26*n),
+                  y=rep(letters,each=n),
+                  v=rnorm(n*26^2))
> DT = data.table(DF,key="x,y")
> tables()

1.2   Grouping

This is a repeat of the test in section 2 of the Introduction vignette. The syntax is explained there.

```
