## 1 Introduction

For the R community, the packages `igraph`, `graph`, `RBGL` and `Rgraphviz` are extremely useful tools for graph operations, manipulation and layout. The **gRbase** package adds some additional tools to these fine packages. The most important tools are:

1. Undirected and directed acyclic graphs can be specified using formulae or an adjacency list using the functions `ug()` and `dag()`. This gives graphs represented in one of the following four forms:
  - `graphNEL` objects (the default),
  - adjacency matrices. There are two type of adjacency matrices in this context: A “standard” matrix in R and a sparse matrix (or to be precise: a `dgCMatrix` in the `Matrix` package).
  - `igraphs`
2. Some graph algorithms are implemented in `gRbase`. These can be applied to graphs represented as `graphNELs` and matrices. Some can also be applied to `igraphs` but we are not consistent with respect to this. The most important algorithms are:
  - `mcs()`, (maximum cardinality search)
  - `moralize()`, (moralization of directed acyclic graph),
  - `rip()`, (RIP ordering of cliques of triangulated undirected graph),
  - `triangulate()`, (triangulate undirected graph).
3. Furthermore corresponding to some of the functions in the `graph` and `RBGL` packages there are corresponding matrix versions of these implemented in `gRbase`. These are: `maxCliqueMAT()`.

## 2 Graphs

Undirected graphs can be created by the `ug()` function and directed acyclic graphs (DAGs) by the `dag()` function.

The graphs can be specified either using formulae or a list of vectors; see examples below.

### 2.1 Undirected graphs

An undirected graph is created by the `ug()` function.

**As `graphNEL`:** The following specifications are equivalent (notice that “:” and “\*” can be used interchangeably):

```
ug11 <- ug(~a:b:c + c:d + d:e + a:e + f:g)
ug11 <- ug(~a*b*c + c*d + d*e + a*e + f*g)
ug12 <- ug(c("a", "b", "c"), c("c", "d"), c("d", "e"), c("a", "e"), c("f", "g"))
ug13 <- ug(~a:b:c, ~c:d, ~d:e + a:e + f:g)
ug13 <- ug(~a*b*c, ~c*d, ~d*e + a*e + f*g)
```

```
ug11
```

```
A graphNEL graph with undirected edges  
Number of Nodes = 7  
Number of Edges = 7
```

**As adjacency matrix:** A representation as an adjacency matrix can be obtained with one of the following equivalent specifications:

```
ug11m <- ug(~a*b*c + c*d + d*e + a*e + f*g, result="matrix")  
ug12m <- ug(c("a","b","c"),c("c","d"),c("d","e"),c("a","e"),c("f","g"),  
            result="matrix")
```

```
ug11m
```

```
  a b c d e f g  
a 0 1 1 0 1 0 0  
b 1 0 1 0 0 0 0  
c 1 1 0 1 0 0 0  
d 0 0 1 0 1 0 0  
e 1 0 0 1 0 0 0  
f 0 0 0 0 0 0 1  
g 0 0 0 0 0 1 0
```

```
ug11M <- ug(~a*b*c + c*d + d*e + a*e + f*g, result="Matrix")  
ug12M <- ug(c("a","b","c"),c("c","d"),c("d","e"),c("a","e"),c("f","g"),  
            result="Matrix")
```

```
ug11M
```

```
7 x 7 sparse Matrix of class "dgCMatrix"  
  a b c d e f g  
a . 1 1 . 1 . .  
b 1 . 1 . . . .  
c 1 1 . 1 . . .  
d . . 1 . 1 . .  
e 1 . . 1 . . .  
f . . . . . . 1  
g . . . . . 1 .
```

**As igraph:** A representation as an `igraph` object can be obtained with one of the following equivalent specifications:

```
ug11i <- ug(~a*b*c + c*d + d*e + a*e + f*g, result="igraph")
ug12i <- ug(c("a","b","c"),c("c","d"),c("d","e"),c("a","e"),c("f","g"),
           result="igraph")
```

```
ug11i
IGRAPH UNW- 7 7 --
+ attr: name (v/c), label (v/c), weight (e/n)
```

## 2.2 Directed acyclic graphs (DAGs)

A directed acyclic graph is created by the `dag()` function.

**As graphNEL:** The following specifications are equivalent (notice that “:” and “\*” can be used interchangeably):

```
dag11 <- dag(~a + b:a + c:a:b + d:c:e + e:a + g:f)
dag11 <- dag(~a + b*a + c*a*b + d*c*e + e*a + g*f)
dag12 <- dag("a", c("b","a"), c("c","a","b"), c("d","c","e"),
           c("e","a"),c("g","f"))
dag13 <- dag(~a, ~b:a, ~c:a:b, ~d:c:e, ~e:a, ~g:f)
dag13 <- dag(~a, ~b*a, ~c*a*b, ~d*c*e, ~e*a, ~g*f)
```

```
dag11
A graphNEL graph with directed edges
Number of Nodes = 7
Number of Edges = 7
```

Here `~a` means that “a” has no parents while `~d:b:c` means that “d” has parents “b” and “c”.

**As adjacency matrix:** A representation as an adjacency matrix can be obtained with

```
dag11m <- dag(~a + b:a + c:a:b + d:c:e + e:a + g:f, result="matrix")
dag12m <- dag("a", c("b","a"), c("c","a","b"), c("d","c","e"),
           c("e","a"),c("g","f"), result="matrix")
```

```
dag11m
```

```
  a b c d e g f
a 0 1 1 0 1 0 0
b 0 0 1 0 0 0 0
c 0 0 0 1 0 0 0
d 0 0 0 0 0 0 0
e 0 0 0 1 0 0 0
g 0 0 0 0 0 0 0
f 0 0 0 0 0 0 1
```

```
dag11M <- dag(~a + b:a + c:a:b + d:c:e + e:a + g:f, result="Matrix")
dag12M <- dag("a", c("b","a"), c("c","a","b"), c("d","c","e"),
              c("e","a"),c("g","f"), result="Matrix")
```

```
dag11M
```

```
7 x 7 sparse Matrix of class "dgCMatrix"
  a b c d e g f
a . 1 1 . 1 . .
b . . 1 . . . .
c . . . 1 . . .
d . . . . . . .
e . . . 1 . . .
g . . . . . . .
f . . . . . 1 .
```

As `igraph`: A representation as an `igraph` object can be obtained with

```
dag11i <- dag(~a + b:a + c:a:b + d:c:e + e:a + g:f, result="igraph")
dag12i <- dag("a", c("b","a"), c("c","a","b"), c("d","c","e"),
              c("e","a"),c("g","f"), result="igraph")
```

### 3 Graph coercion

Graphs can be coerced between different representations using `as()`; for example

```

as(ug11,"igraph")

IGRAPH UNW- 7 7 --
+ attr: name (v/c), label (v/c), weight (e/n)

as(as(ug11,"igraph"),"matrix")

  a b c d e f g
a 0 1 1 0 1 0 0
b 1 0 1 0 0 0 0
c 1 1 0 1 0 0 0
d 0 0 1 0 1 0 0
e 1 0 0 1 0 0 0
f 0 0 0 0 0 0 1
g 0 0 0 0 0 1 0

as(as(as(ug11,"igraph"),"matrix"),"graphNEL")

A graphNEL graph with undirected edges
Number of Nodes = 7
Number of Edges = 7

as(as(as(as(ug11,"igraph"),"matrix"),"graphNEL"),"Matrix")

7 x 7 sparse Matrix of class "dgCMatrix"
  a b c d e f g
a . 1 1 . 1 . .
b 1 . 1 . . . .
c 1 1 . 1 . . .
d . . 1 . 1 . .
e 1 . . 1 . . .
f . . . . . 1
g . . . . . 1 .

```

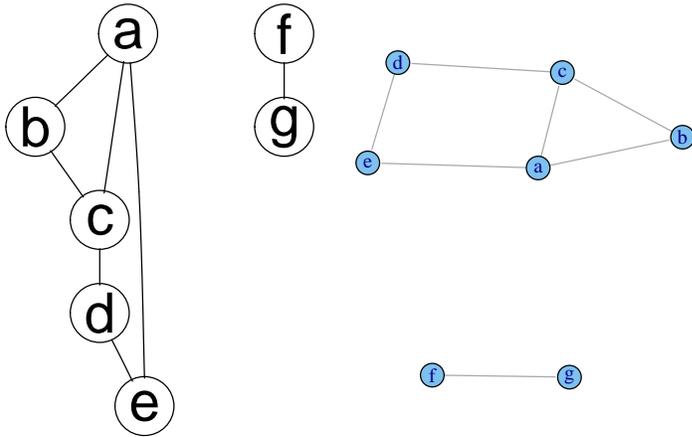

## 4 Plotting graphs

**Graphs represented as graphNELs and igraphs:** Graphs represented as graphNEL objects and igraph objects are displayed with `plot()`.

```

par(mfrow=c(1,2))
plot(ug11)
plot(ug11i)

```

**Graphs represented as adjacency matrices:** There is no plot method for graphs represented as adjacency matrices in **gRbase** but the `gplot()` function in the **sna** package has these facilities:

```

par(mfrow=c(1,2))
library(sna)
gplot(ug11m, label=colnames(ug11m), gmode="graph")
gplot(dag11m, label=colnames(dag11m))

```

## 5 Graph queries

The **graph** and **RBGL** packages implement various graph operations for **graphNEL** objects. See the documentation for these packages. The **gRbase** implements a few additional functions, see Section 1. An additional function in **gRbase** for graph operations is `querygraph()`. This function is intended as a wrapper for the various graph operations available in **gRbase**, **graph** and **RBGL**. There are two main virtues of `querygraph()`: 1) `querygraph()` operates on any of the three graph representations described above<sup>1</sup> and 2) `querygraph()` provides a unified interface to the graph operations. The general syntax is

```

args(querygraph)

function (object, op, set = NULL, set2 = NULL, set3 = NULL)
NULL

```

<sup>1</sup>Actually not quite yet, but it will be so in the future.

## 6 Advanced graph operations

### 6.1 Moralization

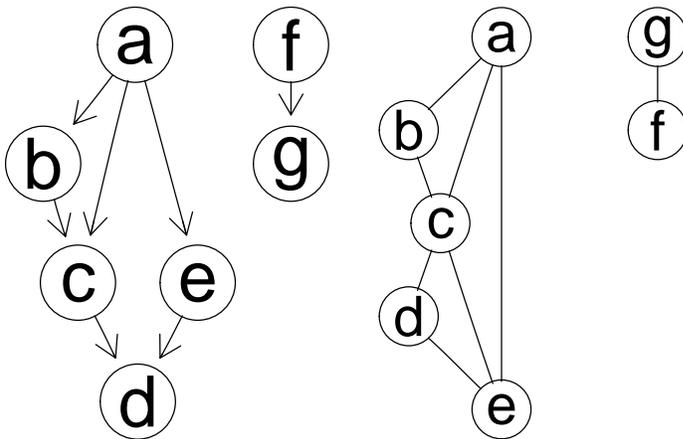

```
apropos("~moralize\\.")
```

```
[1] "moralize.Matrix" "moralize.graphNEL" "moralize.igraph"  
[4] "moralize.matrix"
```

A moralized directed acyclic graph is obtained with

```
dag11.mor <- moralize(dag11)
```

```
par(mfrow=c(1,2))  
plot(dag11)  
plot(dag11.mor)
```

For the alternative representations

```

moralize(dag11m)

  a b c d e g f
a 0 1 1 0 1 0 0
b 1 0 1 0 0 0 0
c 1 1 0 1 1 0 0
d 0 0 1 0 1 0 0
e 1 0 1 1 0 0 0
g 0 0 0 0 0 0 1
f 0 0 0 0 0 1 0

moralize(dag11M)

7 x 7 sparse Matrix of class "dgCMatrix"
  a b c d e g f
a . 1 1 . 1 . .
b 1 . 1 . . . .
c 1 1 . 1 1 . .
d . . 1 . 1 . .
e 1 . 1 1 . . .
g . . . . . 1
f . . . . . 1 .

moralize(dag11i)

IGRAPH UN-- 7 8 --
+ attr: name (v/c), label (v/c)

```

## 6.2 Maximum cardinality search

```

apropos("^mcs\\.")

[1] "mcs.Matrix"      "mcs.graphNEL"  "mcs.igraph"    "mcs.matrix"

```

Testing for whether a graph is triangulated is based on Maximum Cardinality Search. If `character(0)` is returned the graph is not triangulated. Otherwise a linear ordering of the nodes is returned.

```

mcs(ug11)
character(0)

mcs(ug11m)
character(0)

mcs(ug11M)
character(0)

mcs(ug11i)
character(0)

```

```

mcs(dag11.mor)
[1] "a" "b" "c" "e" "d" "g" "f"

mcs(as(dag11.mor,"matrix"))
[1] "a" "b" "c" "e" "d" "g" "f"

mcs(as(dag11.mor,"Matrix"))
[1] "a" "b" "c" "e" "d" "g" "f"

mcs(as(dag11.mor,"igraph"))
[1] "a" "b" "c" "e" "d" "g" "f"

mcs(dag11)
character(0)

```

### 6.3 Triangulation

```

apropos("^triangulate\\.\\.")
[1] "triangulate.Matrix" "triangulate.graphNEL" "triangulate.igraph"
[4] "triangulate.matrix"

```

Triangulate an undirected graph by adding extra edges to the graph:

```

(tug11<-triangulate(ug11))

A graphNEL graph with undirected edges
Number of Nodes = 7
Number of Edges = 8

(tug11m<-triangulate(ug11m))

  a b c d e f g
a 0 1 1 0 1 0 0
b 1 0 1 0 0 0 0
c 1 1 0 1 1 0 0
d 0 0 1 0 1 0 0
e 1 0 1 1 0 0 0
f 0 0 0 0 0 0 1
g 0 0 0 0 0 1 0

(tug11M<-triangulate(ug11M))

7 x 7 sparse Matrix of class "dgCMatrix"
  a b c d e f g
a . 1 1 . 1 . .
b 1 . 1 . . . .
c 1 1 . 1 1 . .
d . . 1 . 1 . .
e 1 . 1 1 . . .
f . . . . . 1
g . . . . . 1 .

(tug11i<-triangulate(ug11i))

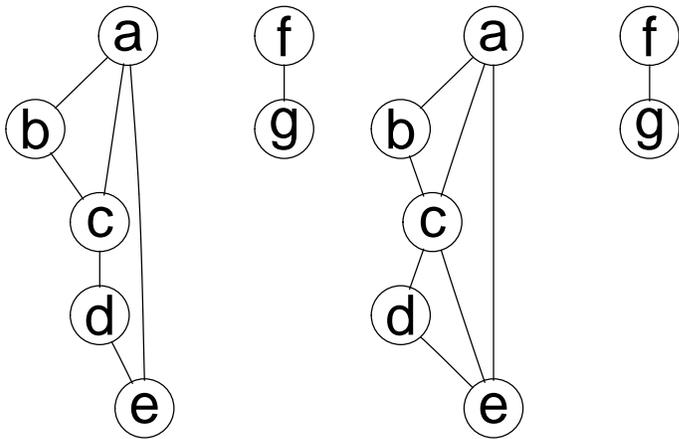

IGRAPH UN-- 7 8 --
+ attr: name (v/c), label (v/c)

```

```

par(mfrow=c(1,2))
plot(ug11)
plot(tug11)

```

## 6.4 RIP ordering / junction tree

```

apropos("^rip\\.")

[1] "rip.Matrix"  "rip.graphNEL" "rip.igraph"  "rip.matrix"

```

A RIP ordering of the cliques of a triangulated graph can be obtained as:

```

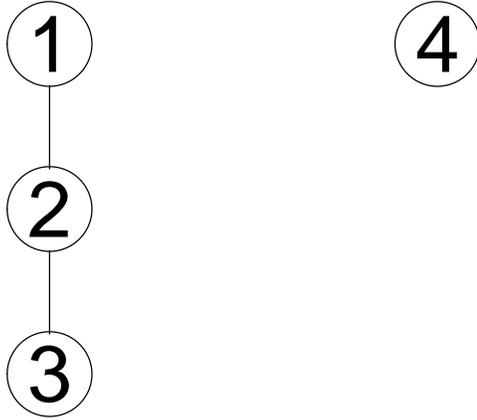

rr <- rip(tug11)
rr

cliques
 1 : c a b
 2 : e a c
 3 : d c e
 4 : g f
separators
 1 :
 2 : a c
 3 : c e
 4 :
parents
 1 : 0
 2 : 1
 3 : 2
 4 : 0

rr <- rip(tug11m)
rr <- rip(tug11M)

```

```
plot(rr)
```

## 7 Time and space considerations

### 7.1 Time

It is worth noticing that working with graphs represented as `graphNEL` objects is somewhat slower working with graphs represented as adjacency matrices. Consider finding the cliques of an undirected graph represented as a `graphNEL` object or as a matrix:

```
system.time({for (ii in 1:200) maxClique(ug11)}) ## in RBGL

user  system elapsed
0.11  0.00   0.11

system.time({for (ii in 1:200) maxCliqueMAT(ug11m)}) ## in gRbase

user  system elapsed
0.02  0.00   0.01
```

Working with sparse matrices rather than standard matrices slows indexing down:

```
system.time({for (ii in 1:2000) ug11m[2,]})

  user  system elapsed
   0      0         0

system.time({for (ii in 1:2000) ug11M[2,]})

  user  system elapsed
0.76   0.00   0.76
```

However, **gRbase** has some functionality for indexing sparse matrices quickly:

```
system.time({for (ii in 1:2000) sp_getXj(ug11M,2)})

  user  system elapsed
0.03   0.00   0.03
```

## 7.2 Space

The **graphNEL** representation is – at least – in principle more economic in terms of space requirements than the adjacency matrix representation (because the adjacency matrix representation uses a 0 to represent a “missing edge”). The sparse matrix representation is clearly only superior to the standard matrix representation if the graph is sparse:

```

V <- 1:100
M <- 1:10
## Sparse graph
##
g1 <- randomGraph(V, M, 0.05)
length(edgeList(g1))

[1] 94

object.size(g1)

117232 bytes

object.size(as.adjMAT(g1))

51648 bytes

object.size(as.adjMAT(g1, "Matrix"))

15360 bytes

## More dense graph
##
g1 <- randomGraph(V, M, 0.5)
length(edgeList(g1))

[1] 4608

object.size(g1)

3511640 bytes

object.size(as.adjMAT(g1))

51648 bytes

object.size(as.adjMAT(g1, "Matrix"))

123696 bytes

```
