

# Package ‘pastclim’

April 25, 2023

**Type** Package

**Title** Manipulate Time Series of Palaeoclimate Reconstructions

**Version** 1.2.4

**Maintainer** Andrea Manica <am315@cam.ac.uk>

**Description** Methods to easily extract and manipulate palaeoclimate reconstructions for ecological and anthropological analyses, as described in Leonardi et al. (2023) <[doi:10.1111/ecog.06481](https://doi.org/10.1111/ecog.06481)>.

**License** CC BY 4.0

**Language** en-GB

**URL** <https://github.com/EvolEcolGroup/pastclim>,  
<https://evolecolgroup.github.io/pastclim/>

**BugReports** <https://github.com/EvolEcolGroup/pastclim/issues>

**Encoding** UTF-8

**LazyData** true

**LazyDataCompression** xz

**RoxygenNote** 7.2.3

**Depends** R (>= 4.0.0), methods, terra (>= 1.7.18)

**Imports** curl, ncd4, utils

**Suggests** rmarkdown, knitr, sf, ggplot2, testthat (>= 3.0.0), spelling

**VignetteBuilder** knitr

**Config/testthat/edition** 3

**NeedsCompilation** no

**Author** Michela Leonardi [aut],  
Emily Y. Hallet [ctb],  
Robert Beyer [ctb],  
Mario Krapp [ctb],  
Andrea Manica [aut, cre]

**Repository** CRAN

**Date/Publication** 2023-04-25 20:30:02 UTC

**Description**

This dataset covers the last 120k years, at intervals of 1/2 k years, and a resolution of 0.5 degrees in latitude and longitude.

**Details**

If you use this dataset, make sure to cite the original publication:

Beyer, R.M., Krapp, M. & Manica, A. High-resolution terrestrial climate, bioclimate and vegetation for the last 120,000 years. *Sci Data* 7, 236 (2020). doi:[doi.org/10.1038/s4159702005521](https://doi.org/10.1038/s4159702005521)

The version included in `pastclim` has the ice sheets masked, as well as internal seas (Black and Caspian Sea) removed. The latter are based on:

<https://www.marineregions.org/gazetteer.php?p=details&id=4278>

<https://www.marineregions.org/gazetteer.php?p=details&id=4282>

As there is no reconstruction of their depth through time, modern outlines were used for all time steps.

Also, for `bio15`, the coefficient of variation was computed after adding one to monthly estimates, and it was multiplied by 100 following <https://pubs.usgs.gov/ds/691/ds691.pdf>

**Changelog**

v1.1.0 Added monthly variables. Files can be downloaded from: <https://zenodo.org/deposit/7062281>

v1.0.0 Remove ice sheets and internal seas, and use correct formula for `bio15`. Files can be downloaded from: [doi:doi.org/10.6084/m9.figshare.19723405.v1](https://doi.org/10.6084/m9.figshare.19723405.v1)

**Description**

This function deletes old reconstructions that have been superseded in the `data_path`. It assumes that the only files in `data_path` are part of `pastclim` (i.e. there are no custom datasets stored in that directory).

**Usage**

```
clean_data_path(ask = TRUE)
```

**Arguments**

`ask` boolean on whether the user should be asked before deleting

**Value**

TRUE if files are deleted successfully

---

climate\_for\_locations *Extract local climate for one or more locations for a given time slice.*

---

**Description**

Deprecated version of [location\\_slice\(\)](#)

**Usage**

```
climate_for_locations(...)
```

**Arguments**

... arguments to be passed to [location\\_slice\(\)](#)

**Value**

a data.frame with the climatic variables of interest

---

climate\_for\_time\_slice  
*Extract a climate slice for a region*

---

**Description**

Deprecated version of [region\\_slice\(\)](#)

**Usage**

```
climate_for_time_slice(...)
```

**Arguments**

... arguments to be passed to [region\\_slice\(\)](#)

**Value**

a SpatRaster [terra::SpatRaster](#) object, with each variable as a layer.

---

df\_from\_region\_series *Extract data frame from a region series*

---

### Description

Extract the climatic information from a region series and organise them as a data frame.

### Usage

```
df_from_region_series(x, xy = TRUE)
```

### Arguments

x	climate time series generated with <a href="#">region_series()</a>
xy	a boolean whether x and y coordinates should be added to the dataframe (default to TRUE)

### Details

To extract a data frame from a region slice, see [df\\_from\\_region\\_slice\(\)](#).

### Value

a data.frame where each cell each raster layer (i.e. timestep) is a row, and the available variables are columns.

---

df\_from\_region\_slice *Extract data frame from a region slice*

---

### Description

Extract the climatic information from a region slice and organise it as a data frame. This is just a wrapper around [terra::as.data.frame\(\)](#).

### Usage

```
df_from_region_slice(x, xy = TRUE)
```

### Arguments

x	climate time slice (i.e. a <a href="#">terra::SpatRaster</a> ) generated with <a href="#">region_slice()</a>
xy	a boolean whether x and y coordinates should be added to the dataframe (default to TRUE)

**Details**

To extract a data frame from a region series, see [df\\_from\\_region\\_series\(\)](#).

**Value**

a data.frame where each cell the raster is a row, and the available variables are columns.

---

distance_from_sea	<i>Compute a raster of distances from the sea for each land pixel.</i>
-------------------	--

---

**Description**

Get the land mask for a dataset at a given time point, and compute distance from the sea for each land pixel.

**Usage**

```
distance_from_sea(time_bp, dataset)
```

**Arguments**

time_bp	time slice in years before present (negative)
dataset	string defining the dataset to use (a list of possible values can be obtained with <a href="#">get_available_datasets()</a> ). This function will not work on custom datasets.

**Value**

a [terra::SpatRaster](#) of distances

---

download_dataset	<i>Download palaeoclimate reconstructions.</i>
------------------	--

---

**Description**

This function downloads palaeoclimate reconstructions. Files will be stored in the data path of pastclim, which can be inspected with [get\\_data\\_path\(\)](#) and changed with [set\\_data\\_path\(\)](#)

**Usage**

```
download_dataset(dataset, bio_variables = NULL)
```

**Arguments**

- `dataset` string defining dataset to be downloaded (a list of possible values can be obtained with `get_available_datasets()`). This function will not work on custom datasets.
- `bio_variables` one or more variable names to be downloaded. If left to NULL, all variables available for this dataset will be downloaded

**Value**

TRUE if the dataset(s) was downloaded correctly.

---

Example

*Documentation for the Example dataset*

---

**Description**

This dataset is a subset of Beyer2020, used for the vignette of pastclim. Do not use this dataset for any real work, as it might not reflect the most up-to-date version of Beyer2020.

---

`get_available_datasets`

*Get the available datasets.*

---

**Description**

List the datasets available in pastclim. Most functions can also be used on custom datasets by setting `dataset="custom"`

**Usage**

```
get_available_datasets()
```

**Value**

a character vector of the available datasets

---

get\_biome\_classes      *Get the biome classes for a dataset.*

---

### Description

Get a full list of biomes and how their id as coded in the biome variable for a given dataset.

### Usage

```
get_biome_classes(dataset)
```

### Arguments

dataset      string defining dataset to be downloaded (a list of possible values can be obtained with [get\\_available\\_datasets\(\)](#)). This function will not work on custom datasets.

### Value

a data.frame with columns id and category.

---

get\_data\_path      *Get the data path where climate reconstructions are stored*

---

### Description

This function returns the path where climate reconstructions are stored.

### Usage

```
get_data_path(silent = FALSE)
```

### Arguments

silent      boolean on whether a message is returned when data\_path is not set (i.e. equal to NULL)

### Details

The path is stored in an option for pastclim named data\_path. If a configuration file was saved when using [set\\_data\\_path\(\)](#), the path is retrieved from a file named "pastclim\_data.txt", which is found in the directory returned by `tools::R_user_dir("pastclim", "config")` (i.e. the default configuration directory for the package as set in R >= 4.0).

### Value

the data path

---

`get_downloaded_datasets`*Get the variables downloaded for each dataset.*

---

**Description**

List the downloaded variable for each dataset.

**Usage**

```
get_downloaded_datasets(data_path = NULL)
```

**Arguments**

`data_path`      leave it to NULL to use the default `data_path`

**Value**

a list of variable names per dataset.

---

`get_file_for_dataset`    *Get the file details for a variable and dataset.*

---

**Description**

Internal getter function

**Usage**

```
get_file_for_dataset(variable, dataset)
```

**Arguments**

`variable`      one or more variable names to be downloaded  
`dataset`      string defining dataset to be downloaded (a list of possible values can be obtained with `get_available_datasets()`). This function will not work on custom datasets.

**Value**

the filename for that variable and dataset

---

get_ice_mask	<i>Get the ice mask for a dataset.</i>
--------------	--

---

**Description**

Get the ice mask for a dataset at a given time point.

**Usage**

```
get_ice_mask(time_bp, dataset)
```

**Arguments**

time_bp	time slice in years before present (negative)
dataset	string defining dataset to be downloaded (a list of possible values can be obtained with <a href="#">get_available_datasets()</a> ). This function will not work on custom datasets.

**Value**

a binary [terra::SpatRaster](#) with the ice mask as 1s

---

get_land_mask	<i>Get the land mask for a dataset.</i>
---------------	---

---

**Description**

Get the land mask for a dataset at a given time point.

**Usage**

```
get_land_mask(time_bp, dataset)
```

**Arguments**

time_bp	time slice in years before present (negative)
dataset	string defining dataset to be downloaded (a list of possible values can be obtained with <a href="#">get_available_datasets()</a> ). This function will not work on custom datasets.

**Value**

a binary [terra::SpatRaster](#) with the land mask as 1s

---

get\_mis\_time\_steps      *Get time steps for a given MIS*

---

### Description

Get the time steps available in a given dataset for a MIS.

### Usage

```
get_mis_time_steps(mis, dataset, path_to_nc = NULL)
```

### Arguments

mis	string giving the mis; it must use the same spelling as used in <a href="#">mis_boundaries</a>
dataset	string defining dataset to be downloaded (a list of possible values can be obtained with <a href="#">get_available_datasets()</a> ). If set to "custom", then a single nc file is used from "path_to_nc"
path_to_nc	the path to the custom nc file containing the palaeoclimate reconstructions. All the variables of interest need to be included in this file.

### Value

a vector of time steps

---

get\_time\_steps      *Get time steps for a given dataset*

---

### Description

Get the time steps (in time\_bp) available in a given dataset.

### Usage

```
get_time_steps(dataset, path_to_nc = NULL)
```

### Arguments

dataset	string defining dataset to be downloaded (a list of possible values can be obtained with <a href="#">get_available_datasets()</a> ). If set to "custom", then a single nc file is used from "path_to_nc"
path_to_nc	the path to the custom nc file containing the palaeoclimate reconstructions. All the variables of interest need to be included in this file.

### Value

a vector of time steps (in time\_bp)

---

get_varname	<i>Get a the varname for this variable</i>
-------------	--

---

**Description**

Internal function to get the varname for this variable

**Usage**

```
get_varname(variable, dataset)
```

**Arguments**

variable	string defining the variable name
dataset	string defining dataset to be downloaded

**Value**

the name of the variable

---

get_vars_for_dataset	<i>Get a list of variables for a given dataset.</i>
----------------------	---

---

**Description**

This function lists the variables available for a given dataset. Note that the spelling and use of capitals in names might differ from the original publications, as `pastclim` harmonises the names of variables across different reconstructions.

**Usage**

```
get_vars_for_dataset(dataset, path_to_nc = NULL, details = FALSE)
```

**Arguments**

dataset	string defining dataset to be downloaded (a list of possible values can be obtained with <a href="#">get_available_datasets()</a> ).
path_to_nc	the path to the custom nc file containing the palaeoclimate reconstructions.
details	boolean determining whether the output should include information including long names of variables and their units

**Value**

a vector of variable names

---

is_region_series	<i>Check the object is a valid region series</i>
------------------	--

---

### Description

A region series is a `terra::SpatRasterDataset` for which each sub-dataset is a variable, and all variables have the same number of time steps.

### Usage

```
is_region_series(x, strict = FALSE)
```

### Arguments

x	a <code>terra::SpatRasterDataset</code> representing a time series of regional reconstructions obtained from <code>region_series()</code> .
strict	a boolean defining whether to perform a thorough test (see description above for details).

### Details

The standard test only checks that each `SpatRaster` has the same number of layers. The more thorough test (obtained with `strict=TRUE`) actually checks that all time steps are identical by comparing the result of `terra::time()` applied to each variable

### Value

TRUE if the object is a region series

---

Krapp2021	<i>Documentation for the Krapp2021 dataset</i>
-----------	--

---

### Description

This dataset covers the last 800k years, at intervals of 1k years, and a resolution of 0.5 degrees in latitude and longitude.

### Details

If you use this dataset, make sure to cite the original publication:

Krapp, M., Beyer, R.M., Edmundson, S.L. et al. A statistics-based reconstruction of high-resolution global terrestrial climate for the last 800,000 years. *Sci Data* 8, 228 (2021). [doi:doi.org/10.1038/s41597021010093](https://doi.org/10.1038/s41597021010093)

The version included in `pastclim` has the ice sheets masked.

Note that, for bio15, we use the corrected version, which follows <https://pubs.usgs.gov/ds/691/ds691.pdf>

#### Changelog

v1.1.0 Added monthly variables. Files can be downloaded from: <https://zenodo.org/record/7065055>

v1.0.0 Remove ice sheets and use correct formula for bio15. Files can be downloaded from: [doi:doi.org/10.6084/m9.figshare.19733680.v1](https://doi.org/10.6084/m9.figshare.19733680.v1)

---

location_series	<i>Extract a time series of bioclimatic variables for one or more locations.</i>
-----------------	--

---

### Description

This function extract a time series of local climate for a set of locations. Note that this function does not apply any interpolation (as opposed to `location_slice()`). If you have a coastal location that just falls into the water for the reconstructions, you will have to amend the coordinates to put it more firmly on land.

### Usage

```
location_series(
  x,
  time_bp = NULL,
  bio_variables,
  dataset,
  path_to_nc = NULL,
  nn_interpol = FALSE,
  buffer = FALSE,
  directions = 8
)
```

### Arguments

x	a data.frame with columns longitude, ranging -180 to 180, and latitude, from -90 to 90 (and an optional name), or a vector of cell numbers.
time_bp	time slices in years before present (negative values represent time before present, positive values time in the future). This parameter can be a vector of times (the slices need to exist in the dataset), a list with a min and max element setting the range of values, or left to NULL to retrieve all time steps. To check which slices are available, you can use <code>get_time_steps()</code> .
bio_variables	vector of names of variables to be extracted.
dataset	string defining the dataset to use. If set to "custom", then a single nc file is used from "path_to_nc"

path_to_nc	the path to the custom nc file containing the palaeoclimate reconstructions. All the variables of interest need to be included in this file.
nn_interpol	boolean determining whether nearest neighbour interpolation is used to estimate climate for cells that lack such information (i.e. they are under water or ice). By default, interpolation is only performed from the first ring of nearest neighbours; if climate is not available, NA will be returned for that location. The number of neighbours can be changed with the argument directions. nn_interpol defaults to FALSE (this is DIFFERENT from <code>location_slice()</code> ).
buffer	boolean determining whether the variable will be returned as the mean of a buffer around the focal cell. If set to TRUE, it overrides nn_interpol (which provides the same estimates as buffer but only for locations that are in cells with an NA). The buffer size is determined by the argument directions. buffer defaults to FALSE.
directions	character or matrix to indicate the directions in which cells are considered connected when using nn_interpol or buffer. The following character values are allowed: "rook" or "4" for the horizontal and vertical neighbours; "bishop" to get the diagonal neighbours; "queen" or "8" to get the vertical, horizontal and diagonal neighbours; or "16" for knight and one-cell queen move neighbours. If directions is a matrix it should have odd dimensions and have logical (or 0, 1) values.

**Value**

a data.frame with the climatic variables of interest

---

location_slice	<i>Extract local climate for one or more locations for a given time slice.</i>
----------------	--

---

**Description**

This function extract local climate for a set of locations at the appropriate times (selecting the closest time slice available for the specific date associated with each location).

**Usage**

```
location_slice(
  x,
  time_bp = NULL,
  bio_variables,
  dataset,
  path_to_nc = NULL,
  nn_interpol = TRUE,
  buffer = FALSE,
  directions = 8
)
```

**Arguments**

x	a data.frame with columns longitude, ranging -180 to 180, and latitude, from -90 to 90, plus optional columns time_bp and name. Alternatively, a vector of cell numbers.
time_bp	used if no time_bp column is present in x: the dates in years before present (negative values represent time before present, i.e. 1950, positive values time in the future) for each location.
bio_variables	vector of names of variables to be extracted.
dataset	string defining the dataset to use. If set to "custom", then a single nc file is used from "path_to_nc"
path_to_nc	the path to the custom nc file containing the palaeoclimate reconstructions. All the variables of interest need to be included in this file.
nn_interpol	boolean determining whether nearest neighbour interpolation is used to estimate climate for cells that lack such information (i.e. they are under water or ice). By default, interpolation is only performed from the first ring of nearest neighbours; if climate is not available, NA will be returned for that location. The number of neighbours can be changed with the argument directions. nn_interpol defaults to TRUE.
buffer	boolean determining whether the variable will be returned as the mean of a buffer around the focal cell. If set to TRUE, it overrides nn_interpol (which provides the same estimates as buffer but only for locations that are in cells with an NA). The buffer size is determined by the argument directions. buffer defaults to FALSE.
directions	character or matrix to indicate the directions in which cells are considered connected when using nn_interpol or buffer. The following character values are allowed: "rook" or "4" for the horizontal and vertical neighbours; "bishop" to get the diagonal neighbours; "queen" or "8" to get the vertical, horizontal and diagonal neighbours; or "16" for knight and one-cell queen move neighbours. If directions is a matrix it should have odd dimensions and have logical (or 0, 1) values.

**Value**

a data.frame with the climatic variables of interest.

---

mis_boundaries	<i>Time boundaries of marine isotope stages (MIS).</i>
----------------	--

---

**Description**

A dataset containing the beginning and end of MIS.

**Usage**

```
mis_boundaries
```

**Format**

A data frame with 24 rows and 2 variables:

**mis** the stage, a string

**start** the start of a given MIS, in kya

**end** the start of a given MIS, in kya

---

pastclim

*pastclim*

---

**Description**

This R library is designed to provide an easy way to extract and manipulate palaeoclimate reconstructions for ecological and anthropological analyses.

**Details**

The functionalities of pastclim are described in Leonard et al. (2023) [doi:10.1111/ecog.06481](https://doi.org/10.1111/ecog.06481). Please cite it if you use pastclim in your research.

On its dedicated [website](#), you can find Articles giving you a step-by-step [overview of the package](#), and a [cheatsheet](#). There is also a [version](#) of the site updated for the dev version (on the top left, the version number is in red, and will be in the format x.x.x.9xxx, indicating it is a development version).

pastclim currently includes data from Beyer et al 2020, a reconstruction of climate based on the HadCM3 model for the last 120k years, and Krapp et al 2021, which covers the last 800k years. The reconstructions are bias-corrected and downscaled to 0.5 degree. More details on these datasets can be found [here](#). There are also instructions on how to build and use [custom datasets](#).

---

region\_extent

*Region extents.*

---

**Description**

A list of extents for major regions.

**Usage**

```
region_extent
```

**Format**

A list of vectors giving the extents.

---

region_outline	<i>Region outlines.</i>
----------------	-------------------------

---

**Description**

An `sf::sf` object containing outlines for major regions. Outlines that span the antimeridian have been split into multiple polygons.

**Usage**

```
region_outline
```

**Format**

`sf::sf` of outlines.

**name** names of regions

---

region_outline_union	<i>Region outlines unioned.</i>
----------------------	---------------------------------

---

**Description**

An `sf::sf` object containing outlines for major regions. Each outline is represented as a single polygon. If you want multiple polygons, use [region\\_outline](#).

**Usage**

```
region_outline_union
```

**Format**

`sf::sf` of outlines.

**name** names of regions

---

region_series	<i>Extract a time series of climate variables for a region</i>
---------------	--

---

## Description

This function extracts a time series of one or more climate variables for a given dataset covering a region (or the whole world). The function returns a `terra::SpatRasterDataset` object, with each variable as a sub-dataset.

## Usage

```
region_series(  
  time_bp = NULL,  
  bio_variables,  
  dataset,  
  path_to_nc = NULL,  
  ext = NULL,  
  crop = NULL  
)
```

## Arguments

<code>time_bp</code>	time slices in years before present (negative values represent time before present, positive values time in the future). This parameter can be a vector of times (the slices need to exist in the dataset), a list with a min and max element setting the range of values, or left to <code>NULL</code> to retrieve all time steps. To check which slices are available, you can use <code>get_time_steps()</code> .
<code>bio_variables</code>	vector of names of variables to be extracted
<code>dataset</code>	string defining the dataset to use. If set to "custom", then a single nc file is used from "path_to_nc"
<code>path_to_nc</code>	the path to the custom nc file containing the palaeoclimate reconstructions. All the variables of interest need to be included in this file.
<code>ext</code>	an extent, coded as numeric vector (length=4; order= xmin, xmax, ymin, ymax) or a <code>terra::SpatExtent</code> object. If <code>NULL</code> , the full extent of the reconstruction is given.
<code>crop</code>	a polygon used to crop the reconstructions (e.g. the outline of a continental mass). A <code>sf::sfg</code> or a <code>terra::SpatVector</code> object is used to define the polygon.

## Value

a `terra::SpatRasterDataset` object, with each variable as a sub-dataset.

---

`region_slice`*Extract a climate slice for a region*

---

### Description

This function extracts a slice of one or more climate variables for a given dataset covering a region (or the whole world). The function returns a SpatRaster `terra::SpatRaster` object, with each variable as a layer.

### Usage

```
region_slice(  
  time_bp,  
  bio_variables,  
  dataset,  
  path_to_nc = NULL,  
  ext = NULL,  
  crop = NULL  
)
```

### Arguments

<code>time_bp</code>	the time slice in years before present (negative values represent time before present, positive values time in the future). The slice needs to exist in the dataset. To check which slices are available, you can use <code>get_time_steps()</code> .
<code>bio_variables</code>	vector of names of variables to be extracted
<code>dataset</code>	string defining the dataset to use. If set to "custom", then a single nc file is used from "path_to_nc"
<code>path_to_nc</code>	the path to the custom nc file containing the palaeoclimate reconstructions. All the variables of interest need to be included in this file.
<code>ext</code>	an extent, coded as numeric vector (length=4; order= xmin, xmax, ymin, ymax) or a <code>terra::SpatExtent</code> object. If NULL, the full extent of the reconstruction is given.
<code>crop</code>	a polygon used to crop the reconstructions (e.g. the outline of a continental mass). A <code>sf::sfg</code> or a <code>terra::SpatVector</code> object is used to define the polygon.

### Value

a SpatRaster `terra::SpatRaster` object, with each variable as a layer.

---

sample\_region\_series    *Sample points from a region time series*

---

### Description

This function samples points from a region time series. Sampling can either be performed for the same locations at all time steps (if only one value is given for `size`), or for different locations for each time step (if `size` is a vector of length equal to the number of time steps). To sample the same number of points, but different locations, for each time step, provide a vector repeating the same value for each time step.

### Usage

```
sample_region_series(x, size, method = "random", replace = FALSE, na.rm = TRUE)
```

### Arguments

<code>x</code>	a <code>terra::SpatRasterDataset</code> returned by <code>region_series()</code>
<code>size</code>	number of points sampled. A single value is used to sample the same locations across all time steps, a vector of values to sample different locations at each time step.
<code>method</code>	one of the sampling methods from <code>terra::spatSample()</code> . It defaults to "random"
<code>replace</code>	boolean determining whether we sample with replacement
<code>na.rm</code>	boolean determining whether NAs are removed

### Details

This function wraps `terra::spatSample()` to appropriate sample the `terra::SpatRasters` in the `terra::SpatRasterDataset` returned by `region_series()`.

### Value

a `data.frame` with the sampled cells and their respective values for the climate variables.

---

sample\_region\_slice    *Sample points from a region time slice*

---

### Description

This function samples points from a region time slice (i.e. a time point).

### Usage

```
sample_region_slice(x, size, method = "random", replace = FALSE, na.rm = TRUE)
```

**Arguments**

x	a <code>terra::SpatRaster</code> returned by <code>region_slice()</code>
size	number of points sampled.
method	one of the sampling methods from <code>terra::spatSample()</code> . It defaults to "random"
replace	boolean determining whether we sample with replacement
na.rm	boolean determining whether NAs are removed

**Details**

This function wraps `terra::spatSample()` to appropriately sample the `terra::SpatRaster` returned by `region_slice()`. You can also use `terra::spatSample()` directly on a slice (which is a standard `terra::SpatRaster`).

**Value**

a data.frame with the sampled cells and their respective values for the climate variables.

---

set_data_path	<i>Set the data path where climate reconstructions will be stored</i>
---------------	---

---

**Description**

This function sets the path where climate reconstructions will be stored. This information is stored in a file names "pastlim\_data.txt", which is found in the directory returned by `tools::R_user_dir("pastlim", "config")` (i.e. the default configuration directory for the package as set in R >= 4.0).

**Usage**

```
set_data_path(
  path_to_nc = NULL,
  ask = TRUE,
  write_config = TRUE,
  copy_example = TRUE
)
```

**Arguments**

path_to_nc	the path to the file that contains the downloaded reconstructions. If left unset, the default location returned by <code>tools::R_user_dir("pastlim", "data")</code> will be used
ask	boolean on whether the user should be asked to confirm their choices
write_config	boolean on whether the path should be saved in a config file
copy_example	boolean on whether the example dataset should be saved in the data_path

**Value**

TRUE if the path was set correctly

---

set\_data\_path\_for\_CRAN

*Set the data path for examples on CRAN*

---

**Description**

Users should NOT need this function. It is used to set up a data path in the temporary directory for examples and tests to run on CRAN.

**Usage**

```
set_data_path_for_CRAN()
```

**Value**

None

---

slice\_region\_series    *Extract a slice for a time series of climate variables for a region*

---

**Description**

This function extracts a time slice from time series of one or more climate variables for a given dataset covering a region (or the whole world).

**Usage**

```
slice_region_series(x, time_bp)
```

**Arguments**

x	climate time series generated with <a href="#">region_series()</a>
time_bp	time slices in years before present (i.e. 1950, negative integers for values in the past). The slices need to exist in the dataset. To check which slices are available, you can use <code>time_bp(x[[1]])</code> (note that you have to use the <a href="#">time_bp()</a> function on the first element of the <a href="#">terra::SpatRasterDataset</a> object, i.e. on one of the <a href="#">terra::SpatRaster</a> objects)

**Value**

a [SpatRaster](#) of the relevant slice.

---

time\_bp

*Extract and set time in years before present for SpatRaster*

---

### Description

This functions extracts and sets time in years BP (i.e. from 1950) for a `terra::SpatRaster`. In the `terra::SpatRaster` object, time is stored with unit "years", which are years from 0AD. This means that, when a summary of the `terra::SpatRaster` is inspected, the times will appear as `time_bp+1950`. The same applies when the function `terra::time()` is used instead of `time_bp()`.

### Usage

```
time_bp(x)

## S4 method for signature 'SpatRaster'
time_bp(x)

time_bp(x) <- value

## S4 replacement method for signature 'SpatRaster'
time_bp(x) <- value
```

### Arguments

x                    a `terra::SpatRaster`  
value                a numeric vector of times in years BP

### Value

a date in years BP (where negative numbers indicate a date in the past)

---

time\_series\_for\_locations

*Extract a time series of bioclimatic variables for one or more locations.*

---

### Description

Deprecated version of `location_series()`

### Usage

```
time_series_for_locations(...)
```

**Arguments**

... arguments to be passed to `location_series()`

**Value**

a data.frame with the climatic variables of interest

---

update\_dataset\_list     *Update the dataset list*

---

**Description**

If a newer dataset list (which includes all the information about the files storing the data for past-clim), download it and start using it as 'dataset\_list\_included.csv' in `tools::R_user_dir("pastclim", "config")`. If the latter is present, the last column, named 'dataset\_list\_v', provides the version of this table, and the most advanced table is used.

**Usage**

```
update_dataset_list(on_cran = FALSE)
```

**Arguments**

on\_cran            boolean to make this function run on ci tests using tempdir

**Value**

TRUE if the dataset was updated

---

validate\_nc            *Validate an netcdf file for pastclim*

---

**Description**

This function validates a netcdf file as a potential dataset for pastlim. The key checks are: a) that the dimensions (longitude, latitude and time) have been set correctly. b) that all variables have the appropriate metadata (longname and units)

**Usage**

```
validate_nc(path_to_nc)
```

**Arguments**

path\_to\_nc        path to the nc file of interest

**Value**

TRUE if the file is valid.

---

var_labels	<i>Generate pretty variable labels for plotting</i>
------------	---

---

**Description**

Generate pretty labels (in the form of an [expression](#)) that can be used for plotting

**Usage**

```
var_labels(x, dataset, with_units = TRUE, abbreviated = FALSE)
```

**Arguments**

x	either a character vector with the names of the variables, or a <a href="#">terra::SpatRaster</a> generated with <a href="#">[region_slice()]</a> <a href="#">[region_slice()]</a> ; R: <a href="#">region_slice()</a>
dataset	string defining dataset to be downloaded (a list of possible values can be obtained with <a href="#">get_available_datasets()</a> ). This function will not work on custom datasets.
with_units	boolean defining whether the label should include units
abbreviated	boolean defining whether the label should use abbreviations for the variable

**Value**

a [expression](#) that can be used as a label in plots

**Examples**

```
var_labels("bio01", dataset = "Example")

# set the data_path for this example to run on CRAN
# users don't need to run this line
set_data_path_for_CRAN()

# for a SpatRaster
climate_20k <- region_slice(
  time_bp = -20000,
  bio_variables = c("bio01", "bio10", "bio12"),
  dataset = "Example"
)
terra::plot(climate_20k, main = var_labels(climate_20k, dataset = "Example"))
terra::plot(climate_20k, main = var_labels(climate_20k, dataset = "Example",
  abbreviated = TRUE))
```
