

# Package ‘sparsevctrs’

May 31, 2024

**Title** Sparse Vectors for Use in Data Frames

**Version** 0.1.0

**Description** Provides sparse vectors powered by ALTREP (Alternative Representations for R Objects) that behave like regular vectors, and can thus be used in data frames. Also provides tools to convert between sparse matrices and data frames with sparse columns and functions to interact with sparse vectors.

**License** MIT + file LICENSE

**URL** <https://github.com/r-lib/sparsevctrs>,  
<https://r-lib.github.io/sparsevctrs/>

**BugReports** <https://github.com/r-lib/sparsevctrs/issues>

**Depends** R (>= 4.0.0)

**Imports** cli (>= 3.4.0), rlang (>= 1.1.0), vctrs

**Suggests** knitr, Matrix, methods, rmarkdown, testthat (>= 3.0.0),  
tibble, withr

**VignetteBuilder** knitr

**Config/Needs/website** tidyverse/tidytemplate, rmarkdown, lobstr,  
ggplot2, bench, tidyr, ggbeeswarm

**Config/testthat/edition** 3

**Encoding** UTF-8

**RoxygenNote** 7.3.1.9000

**NeedsCompilation** yes

**Author** Emil Hvitfeldt [aut, cre] (<<https://orcid.org/0000-0002-0679-1945>>),  
Davis Vaughan [ctb],  
Posit Software, PBC [cph, fnd]

**Maintainer** Emil Hvitfeldt <[emil.hvitfeldt@posit.co](mailto:emil.hvitfeldt@posit.co)>

**Repository** CRAN

**Date/Publication** 2024-05-31 18:50:03 UTC

--------------	-----------

---

coerce-vector	<i>Coerce numeric vector to sparse double</i>
---------------	-----------------------------------------------

---

### Description

Takes a numeric vector, integer or double, and turn it into a sparse double vector.

### Usage

```
as_sparse_double(x, default = 0)
```

```
as_sparse_integer(x, default = 0L)
```

```
as_sparse_character(x, default = "")
```

```
as_sparse_logical(x, default = FALSE)
```

### Arguments

x a numeric vector.

default default value to use. Defaults to 0.

The values of x must be double or integer. It must not contain any Inf or NaN values.

### Value

sparse vectors

**Examples**

```
x_dense <- c(3, 0, 2, 0, 0, 0, 4, 0, 0, 0)
x_sparse <- as_sparse_double(x_dense)
x_sparse

is_sparse_double(x_sparse)
```

---

coerce\_to\_sparse\_data\_frame

*Coerce sparse matrix to data frame with sparse columns*

---

**Description**

Turning a sparse matrix into a data frame

**Usage**

```
coerce_to_sparse_data_frame(x)
```

**Arguments**

x                    sparse matrix.

**Details**

The only requirement from the sparse matrix is that it contains column names.

**Value**

data.frame with sparse columns

**See Also**

[coerce\\_to\\_sparse\\_tibble\(\)](#) [coerce\\_to\\_sparse\\_matrix\(\)](#)

**Examples**

```
set.seed(1234)
mat <- matrix(sample(0:1, 100, TRUE, c(0.9, 0.1)), nrow = 10)
colnames(mat) <- letters[1:10]
sparse_mat <- Matrix::Matrix(mat, sparse = TRUE)
sparse_mat

res <- coerce_to_sparse_data_frame(sparse_mat)
res

# All columns are sparse
vapply(res, is_sparse_vector, logical(1))
```

---

`coerce_to_sparse_matrix`*Coerce sparse data frame to sparse matrix*

---

## Description

Turning data frame with sparse columns into sparse matrix using `Matrix::sparseMatrix()`.

## Usage

```
coerce_to_sparse_matrix(x)
```

## Arguments

`x` a data frame or tibble with sparse columns.

## Details

No checking is currently do to `x` to determine whether it contains sparse columns or not. Thus it works with any data frame. Needless to say, creating a sparse matrix out of a dense data frame is not ideal.

## Value

sparse matrix

## See Also

[coerce\\_to\\_sparse\\_data\\_frame\(\)](#) [coerce\\_to\\_sparse\\_tibble\(\)](#)

## Examples

```
sparse_tbl <- lapply(1:10, function(x) sparse_double(x, x, length = 10))
names(sparse_tbl) <- letters[1:10]
sparse_tbl <- as.data.frame(sparse_tbl)
sparse_tbl

res <- coerce_to_sparse_matrix(sparse_tbl)
res
```

---

`coerce_to_sparse_tibble`*Coerce sparse matrix to tibble with sparse columns*

---

**Description**

Turning a sparse matrix into a tibble.

**Usage**

```
coerce_to_sparse_tibble(x)
```

**Arguments**

`x` sparse matrix.

**Details**

The only requirement from the sparse matrix is that it contains column names.

**Value**

tibble with sparse columns

**See Also**

[coerce\\_to\\_sparse\\_data\\_frame\(\)](#) [coerce\\_to\\_sparse\\_matrix\(\)](#)

**Examples**

```
set.seed(1234)
mat <- matrix(sample(0:1, 100, TRUE, c(0.9, 0.1)), nrow = 10)
colnames(mat) <- letters[1:10]
sparse_mat <- Matrix::Matrix(mat, sparse = TRUE)
sparse_mat

res <- coerce_to_sparse_tibble(sparse_mat)
res

# All columns are sparse
vapply(res, is_sparse_vector, logical(1))
```

**Description**

Extract positions, values, and default from sparse vectors without the need to materialize vector.

**Usage**

```
sparse_positions(x)
```

```
sparse_values(x)
```

```
sparse_default(x)
```

**Arguments**

x                    vector to be extracted from.

**Details**

`sparse_default()` returns NA when applied to non-sparse vectors. This is done to have an indicator of non-sparsity.

for ease of use, these functions also works on non-sparse variables.

**Value**

vectors of requested attributes

**Examples**

```
x_sparse <- sparse_double(c(pi, 5, 0.1), c(2, 5, 10), 10)
x_dense <- c(0, pi, 0, 0, 0.5, 0, 0, 0, 0, 0.1)
```

```
sparse_positions(x_sparse)
sparse_values(x_sparse)
sparse_default(x_sparse)
```

```
sparse_positions(x_dense)
sparse_values(x_dense)
sparse_default(x_dense)
```

```
x_sparse_3 <- sparse_double(c(pi, 5, 0.1), c(2, 5, 10), 10, default = 3)
sparse_default(x_sparse_3)
```

---

sparse\_character      *Create sparse character vector*

---

## Description

Construction of vectors where only values and positions are recorded. The Length and default values determine all other information.

## Usage

```
sparse_character(values, positions, length, default = "")
```

## Arguments

values	integer vector, values of non-zero entries.
positions	integer vector, indices of non-zero entries.
length	integer value, Length of vector.
default	integer value, value at indices not specified by positions. Defaults to "". Cannot be NA.

## Details

values and positions are expected to be the same length, and are allowed to both have zero length.

Allowed values for value are character values. Missing values such as NA and NA\_real\_ are allowed as they are turned into NA\_character\_. Everything else is disallowed. The values are also not allowed to take the same value as default.

positions should be integers or integer-like doubles. Everything else is not allowed. Positions should furthermore be positive (0 not allowed), unique, and in increasing order. Lastly they should all be smaller than length.

For developers:

setting options("sparsevctrs.verbose\_materialize" = TRUE) will print a message each time a sparse vector has been forced to materialize.

## Value

sparse character vector

## See Also

[sparse\\_double\(\)](#) [sparse\\_integer\(\)](#)

**Examples**

```

sparse_character(character(), integer(), 10)

sparse_character(c("A", "C", "E"), c(2, 5, 10), 10)

str(
  sparse_character(c("A", "C", "E"), c(2, 5, 10), 1000000000)
)

```

---

<code>sparse_double</code>	<i>Create sparse double vector</i>
----------------------------	------------------------------------

---

**Description**

Construction of vectors where only values and positions are recorded. The Length and default values determine all other information.

**Usage**

```
sparse_double(values, positions, length, default = 0)
```

**Arguments**

<code>values</code>	double vector, values of non-zero entries.
<code>positions</code>	integer vector, indices of non-zero entries.
<code>length</code>	integer value, Length of vector.
<code>default</code>	double value, value at indices not specified by <code>positions</code> . Defaults to 0. Cannot be NA.

**Details**

`values` and `positions` are expected to be the same length, and are allowed to both have zero length.

Allowed values for `value` is double and integer values. integer values will be coerced to doubles. Missing values such as NA and NA\_real\_ are allowed. Everything else is disallowed, This includes Inf and NaN. The values are also not allowed to take the same value as default.

`positions` should be integers or integer-like doubles. Everything else is not allowed. Positions should furthermore be positive (0 not allowed), unique, and in increasing order. Lastly they should all be smaller than length.

For developers:

setting `options("sparsevctrs.verbose_materialize" = TRUE)` will print a message each time a sparse vector has been forced to materialize.

**Value**

sparse double vector

**See Also**

[sparse\\_integer\(\)](#) [sparse\\_character\(\)](#)

**Examples**

```
sparse_double(numeric(), integer(), 10)

sparse_double(c(pi, 5, 0.1), c(2, 5, 10), 10)

str(
  sparse_double(c(pi, 5, 0.1), c(2, 5, 10), 1000000000)
)
```

---

sparse_integer	<i>Create sparse integer vector</i>
----------------	-------------------------------------

---

**Description**

Construction of vectors where only values and positions are recorded. The Length and default values determine all other information.

**Usage**

```
sparse_integer(values, positions, length, default = 0L)
```

**Arguments**

values	integer vector, values of non-zero entries.
positions	integer vector, indices of non-zero entries.
length	integer value, Length of vector.
default	integer value, value at indices not specified by positions. Defaults to 0L. Cannot be NA.

**Details**

values and positions are expected to be the same length, and are allowed to both have zero length.

Allowed values for value is integer values. This means that the double vector `c(1, 5, 4)` is accepted as it can be losslessly converted to the integer vector `c(1L, 5L, 4L)`. Missing values such as `NA` and `NA_real_` are allowed. Everything else is disallowed, This includes `Inf` and `NaN`. The values are also not allowed to take the same value as default.

positions should be integers or integer-like doubles. Everything else is not allowed. Positions should furthermore be positive (0 not allowed), unique, and in increasing order. Lastly they should all be smaller than length.

For developers:

setting `options("sparsevctrs.verbose_materialize" = TRUE)` will print a message each time a sparse vector has been forced to materialize.

**Value**

sparse integer vector

**See Also**

[sparse\\_double\(\)](#) [sparse\\_character\(\)](#)

**Examples**

```
sparse_integer(integer(), integer(), 10)

sparse_integer(c(4, 5, 7), c(2, 5, 10), 10)

str(
  sparse_integer(c(4, 5, 7), c(2, 5, 10), 1000000000)
)
```

---

sparse_logical	<i>Create sparse logical vector</i>
----------------	-------------------------------------

---

**Description**

Construction of vectors where only values and positions are recorded. The Length and default values determine all other information.

**Usage**

```
sparse_logical(values, positions, length, default = FALSE)
```

**Arguments**

values	logical vector, values of non-zero entries.
positions	integer vector, indices of non-zero entries.
length	integer value, Length of vector.
default	logical value, value at indices not specified by positions. Defaults to FALSE. Cannot be NA.

**Details**

values and positions are expected to be the same length, and are allowed to both have zero length. Allowed values for value are logical values. Missing values such as NA and NA\_real\_ are allowed. Everything else is disallowed, The values are also not allowed to take the same value as default.

positions should be integers or integer-like doubles. Everything else is not allowed. Positions should furthermore be positive (0 not allowed), unique, and in increasing order. Lastly they should all be smaller than length.

For developers:

setting options("sparsevctrs.verbose\_materialize" = TRUE) will print a message each time a sparse vector has been forced to materialize.

**Value**

sparse logical vector

**See Also**

[sparse\\_double\(\)](#) [sparse\\_integer\(\)](#) [sparse\\_character\(\)](#)

**Examples**

```
sparse_logical(logical(), integer(), 10)

sparse_logical(c(TRUE, NA, TRUE), c(2, 5, 10), 10)

str(
  sparse_logical(c(TRUE, NA, TRUE), c(2, 5, 10), 1000000000)
)
```

---

type-predicates

*Sparse vector type checkers*

---

**Description**

Helper functions to determine whether an vector is a sparse vector or not.

**Usage**

```
is_sparse_vector(x)

is_sparse_numeric(x)

is_sparse_double(x)

is_sparse_integer(x)

is_sparse_character(x)

is_sparse_logical(x)
```

**Arguments**

x value to be checked.

**Details**

`is_sparse_vector()` is a general function that detects any type of sparse vector created with this package. `is_sparse_double()`, `is_sparse_integer()`, `is_sparse_character()`, and `is_sparse_logical()` are more specific functions that only detects the type. `is_sparse_numeric()` matches both sparse integers and doubles.

**Value**

single logical value

**Examples**

```
x_sparse <- sparse_double(c(pi, 5, 0.1), c(2, 5, 10), 10)
x_dense <- c(0, pi, 0, 0, 0.5, 0, 0, 0, 0, 0.1)
```

```
is_sparse_vector(x_sparse)
is_sparse_vector(x_dense)
```

```
is_sparse_double(x_sparse)
is_sparse_double(x_dense)
```

```
is_sparse_character(x_sparse)
is_sparse_character(x_dense)
```

```
# Forced materialization
is_sparse_vector(x_sparse[])
```
