

Package ‘weyl’

December 21, 2022

Type Package

Title The Weyl Algebra

Version 0.0-3

Depends spray ($\geq 1.0-19$), methods, R ($\geq 3.5.0$)

Maintainer Robin K. S. Hankin <hankin.robin@gmail.com>

Description A suite of routines for Weyl algebras. Notation follows Coutinho (1995, ISBN 0-521-55119-6, ``A Primer of Algebraic D-Modules"). Uses 'disordR' discipline (Hankin 2022 <doi:10.48550/ARXIV.2210.03856>). To cite the package in publications, use Hankin 2022 <doi:10.48550/ARXIV.2212.09230>.

License GPL (≥ 2)

LazyData yes

Suggests knitr,rmarkdown,testthat

VignetteBuilder knitr

Imports mathjaxr, disordR ($\geq 0.0-8$), freealg ($\geq 1.0-4$)

URL <https://github.com/RobinHankin/weyl>

rweyl	Random weyl objects
weyl	The algebra and weyl objects
weyl-class	Class "weyl"
weyl-package	The Weyl Algebra
x_and_d	Generating elements for the first Weyl algebra
zero	The zero operator

Author(s)

NA

Maintainer: Robin K. S. Hankin <hankin.robin@gmail.com>

Examples

```
x <- rweyl(d=1)
y <- rweyl(d=1)
z <- rweyl(d=1)

is.zero(x*(y*z) - (x*y)*z) # should be TRUE
```

coeffs

*Manipulate the coefficients of a weyl object***Description**

Manipulate the coefficients of a weyl object. The coefficients are disord objects.

Usage

```
coeffs(S) <- value
```

Arguments

S	A weyl object
value	Numeric

Details

To access coefficients of a weyl object S, use `spray::coeffs(S)` [package idiom is `coeffs(S)`]. Similarly to access the index matrix use `index(s)`.

The replacement method is package-specific; use `coeffs(S) <-value`.

Value

Extraction methods return a disord object (possibly dropped); replacement methods return a weyl object.

Author(s)

Robin K. S. Hankin

Examples

```
(a <- rweyl(9))
coeffs(a)
coeffs(a)[coeffs(a)<3] <- 100
a
```

constant

The constant term

Description

The *constant* of a *weyl* object is the coefficient of the term with all zeros.

Usage

```
constant(x, drop = TRUE)
constant(x) <- value
```

Arguments

x	Object of class <i>weyl</i>
drop	Boolean with default TRUE meaning to return the value of the coefficient, and FALSE meaning to return the corresponding Weyl object
value	Constant value to replace existing one

Value

Returns a numeric or *weyl* object

Note

The `constant.weyl()` function is somewhat awkward because it has to deal with the difficult case where the constant is zero and `drop=FALSE`.

Author(s)

Robin K. S. Hankin

Examples

```
(a <- rweyl()+700)
constant(a)
constant(a, drop=FALSE)

constant(a) <- 0
constant(a)
constant(a, drop=FALSE)

constant(a+66) == constant(a) + 66
```

 degree

The degree of a weyl object

Description

The *degree* of a monomial weyl object $x^a \partial^b$ is defined as $a + b$. The degree of a general weyl object expressed as a linear combination of monomials is the maximum of the degrees of these monomials. Following Coutinho we have:

- $\deg(d_1 + d_2) \leq \max(\deg(d_1) + \deg(d_2))$
- $\deg(d_1 d_2) = \deg(d_1) + \deg(d_2)$
- $\deg(d_1 d_2 - d_2 d_1) \leq \deg(d_1) + \deg(d_2) - 2$

Usage
`deg(S)`
Arguments

S Object of class weyl

Value

Nonnegative integer (or $-\infty$ for the zero Weyl object)

Note

The degree of the zero object is conventionally $-\infty$.

Author(s)

Robin K. S. Hankin

Examples

```
(a <- rweyl())
deg(a)

d1 <- rweyl(n=2)
d2 <- rweyl(n=2)

deg(d1+d2) <= deg(d1) + deg(d2)
deg(d1*d2) == deg(d1) + deg(d2)
deg(d1*d2-d2*d1) <= deg(d1) + deg(d2) -2
```

derivation	<i>Derivations</i>
------------	--------------------

Description

A *derivation* D of an algebra A is a linear operator that satisfies $D(d_1 d_2) = d_1 D(d_2) + D(d_1) d_2$, for every $d_1, d_2 \in A$. If a derivation is of the form $D(d) = [d, f] = df - fd$ for some fixed $f \in A$, we say that D is an *inner* derivation.

Function `as.der()` returns a derivation with `as.der(f)(g)=fg-gf`.

Usage

```
as.der(S)
```

Arguments

S Weyl object

Value

Returns a function, a derivation

Author(s)

Robin K. S. Hankin

Examples

```
(o <- rweyl(n=2,d=2))
(f <- as.der(o))

d1 <-rweyl(n=1,d=2)
d2 <-rweyl(n=2,d=2)

f(d1*d2) == d1*f(d2) + f(d1)*d2 # should be TRUE
```

dim	<i>The dimension of a weyl object</i>
-----	---------------------------------------

Description

The *dimension* of a weyl algebra is the number of variables needed; it is half the `spray::arity()`. The *dimension* of a Weyl algebra generated by $\{x_1, x_2, \dots, x_n, \partial_{x_1}, \partial_{x_2}, \dots, \partial_{x_n}\}$ is n . It is the number of variables needed for the operators; it is half the `spray::arity()`.

Usage

```
## S3 method for class 'weyl'
dim(x)
```

Arguments

x Object of class weyl

Value

Integer

Note

Empty spray objects give zero-dimensional weyl objects.

Author(s)

Robin K. S. Hankin

Examples

```
(a <- rweyl())
dim(a)
```

dot-class

Class "dot"

Description

The dot object is defined so that idiom like `.[x,y]` returns the commutator, that is, $xy-yx$.

The dot object is generated by running script `inst/dot.Rmd`, which includes some further discussion and technical documentation, and creates file `dot.rda` which resides in the `data/` directory.

Arguments

x Object of any class
 i, j elements to commute
 ... Further arguments to `dot_error()`, currently ignored

Value

Always returns an object of the same class as `xy`.

Author(s)

Robin K. S. Hankin

Examples

```
x <- rweyl(n=1,d=2)
y <- rweyl(n=1,d=2)
z <- rweyl(n=1,d=2)

.[x,.[y,z]] + .[y,.[z,x]] + .[z,.[x,y]] # Jacobi identity
```

drop	<i>Drop redundant information</i>
------	-----------------------------------

Description

Coerce constant weyl objects to numeric

Usage

```
drop(x)
```

Arguments

x Weyl object

Details

If its argument is a constant weyl object, coerce to numeric.

Value

Returns either a length-one numeric vector or its argument, a weyl object

Note

Many functions in the package take drop as an argument which, if TRUE, means that the function returns a dropped value.

Author(s)

Robin K. S. Hankin

Examples

```
a <- rweyl() + 67
drop(a)

drop(idweyl(9))

drop(constant(a, drop=FALSE))
```

grade *The grade of a weyl object*

Description

The *grade* of a homogeneous term of a Weyl algebra is the sum of the powers. Thus the grade of $4xy^2\partial_x^3\partial_y^4$ is $1 + 2 + 3 + 4 = 10$.

The functionality documented here closely follows the equivalent in the **clifford** package.

Coutinho calls this the *symbol map*.

Usage

```
grade(C, n, drop=TRUE)
grade(C,n) <- value
grades(x)
```

Arguments

C, x	Weyl object
n	Integer vector specifying grades to extract
value	Replacement value, a numeric vector
drop	Boolean, with default TRUE meaning to coerce a constant operator to numeric, and FALSE meaning not to

Details

Function `grades()` returns an (unordered) vector specifying the grades of the constituent terms. Function `grades<-()` allows idiom such as `grade(x, 1:2) <- 7` to operate as expected [here to set all coefficients of terms with grades 1 or 2 to value 7].

Function `grade(C, n)` returns a Weyl object with just the elements of grade g , where $g \%in\% n$.

The zero grade term, `grade(C, 0)`, is given more naturally by `constant(C)`.

Value

Integer vector or weyl object

Author(s)

Robin K. S. Hankin

Examples

```
a <- rweyl(30)

grades(a)
grade(a, 1:4)
grade(a, 5:9) <- -99
a
```

identity

The identity operator

Description

The identity operator maps any function to itself.

Usage

```
idweyl(d)
## S3 method for class 'weyl'
as.id(S)
is.id(S)
```

Arguments

d	Integer specifying dimensionality of the weyl object (twice the spray arity)
S	A weyl object

Value

A weyl object corresponding to the identity operator

Note

The identity function cannot be called “`id()`” because then R would not know whether to create a spray or a weyl object.

Examples

```
idweyl(7)

a <- rweyl(d=5)
a
is.id(a)
is.id(1+a-a)
as.id(a)

a == a*1
a == a*as.id(a)
```

Description

Allows arithmetic operators to be used for spray calculations, such as addition, multiplication, division, integer powers, etc.

Idiom such as $x^2 + y*z/5$ should work as expected. Operations are the same as those of the **spray** package except for $*$, which is interpreted as functional composition. A number of helper functions are documented here (which are not designed for the end-user).

Usage

```
## S3 method for class 'weyl'
Ops(e1, e2 = NULL)
weyl_prod_helper1(a,b,c,d)
weyl_prod_helper2(a,b,c,d)
weyl_prod_helper3(a,b,c,d)
weyl_prod_univariate_onerow(S1,S2,func)
weyl_prod_univariate_nrow(S1,S2)
weyl_prod_multivariate_onerow_singlecolumn(S1,S2,column)
weyl_prod_multivariate_onerow_allcolumns(S1,S2)
weyl_prod_multivariate_nrow_allcolumns(S1,S2)
weyl_power_scalar(S,n)
```

Arguments

$S, S1, S2, e1, e2$	Objects of class <code>weyl</code> , elements of a Weyl algebra
a, b, c, d	Integers, see details
<code>column</code>	column to be multiplied
n	Integer power (non-negative)
<code>func</code>	Function used for products

Details

All arithmetic is as for spray objects, apart from $*$ and $^$. Here, $*$ is interpreted as operator concatenation: Thus, if w_1 and w_2 are Weyl objects, then $w_1 w_2$ is defined as the operator that takes f to $w_1(w_2 f)$.

Functions such as `weyl_prod_multivariate_nrow_allcolumns()` are low-level helper functions with self-explanatory names. In this context, “univariate” means the first Weyl algebra, generated by $\{x, \partial\}$, subject to $x\partial - \partial x = 1$; and “multivariate” means the algebra generated by $\{x_1, x_2, \dots, x_n, \partial_{x_1}, \partial_{x_2}, \dots, \partial_{x_n}\}$.

The product is somewhat user-customisable via option `prodfunc`, which affects function `weyl_prod_univariate_onerow`. Currently the package offers three examples: `weyl_prod_helper1()`, `weyl_prod_helper2()`, and `weyl_prod_helper3()`. These are algebraically identical but occupy different positions on the efficiency-readability scale. The option defaults to `weyl_prod_helper3()`, which is the fastest but most opaque. The vignette provides further details, motivation, and examples.

Value

Generally, return a weyl object

Note

Function weyl_prod_univariate_nrow() is present for completeness, it is not used in the package

Author(s)

Robin K. S. Hankin

Examples

```
x <- rweyl(n=1,d=2)
y <- rweyl(n=1,d=2)
z <- rweyl(n=2,d=2)

x*(y+z) == x*y + x*z
is.zero(x*(y*z) - (x*y)*z)
```

```
print.weyl
```

```
Print methods for weyl objects
```

Description

Printing methods for weyl objects follow those for the **spray** package, with some additional functionality.

Usage

```
## S3 method for class 'weyl'
print(x, ...)
```

Arguments

x	A weyl object
...	Further arguments, currently ignored

Details

Option polyform determines whether the object is to be printed in matrix form or polynomial form: as in the **spray** package, this option governs dispatch to either print_spray_polyform() or print_spray_matrixform().

```
> a <- rweyl()
> a # default print method
A member of the Weyl algebra:
  x y z dx dy dz val
  1 2 2 2 1 0 = 3
  2 2 0 0 1 1 = 2
```

```

  0 0 0 1 1 2 = 1
> options(polyform = TRUE)
> a
A member of the Weyl algebra:
+3*x*y^2*z^2*dx^2*dy +2*x^2*y^2*dy*dz +dx*dy*dz^2
> options(polyform = FALSE) # restore default

```

Irrespective of the value of `polyform`, option `weylvars` controls the variable names. If `NULL` (the default), then sensible values are used: either `[xyz]` if the dimension is three or less, or integers. But option `weylvars` is user-settable:

```

> options(weylvars=letters[18:20])
> a
A member of the Weyl algebra:
  r  s  t dr ds dt   val
  1  2  2  2  1  0 =   3
  2  2  0  0  1  1 =   2
  0  0  0  1  1  2 =   1
> options(polyform=TRUE)
> a
A member of the Weyl algebra:
+3*r*s^2*t^2*dr^2*ds +2*r^2*s^2*ds*dt +dr*ds*dt^2
> options(polyform=FALSE) ; options(weylvars=NULL)

```

If the user sets `weylvars`, the `print` method tries to do the Right Thing (tm). If set to `c("a", "b", "c")`, for example, the generators are named `c(" a", " b", " c", "da", "db", "dc")` [note the spaces]. If the algebra is univariate, the names will be something like `d` and `x`. No checking is performed and if the length is not equal to the dimension, undesirable behaviour may occur. For the love of God, do not use a variable named `d`. Internally, `weylvars` works by changing the `sprayvars` option in the **spray** package.

Note that, as for the **spray** package, this option has no algebraic significance: it only affects the `print` method.

Value

Returns a `weyl` object.

Author(s)

Robin K. S. Hankin

Examples

```

a <- rweyl()
print(a)
options(polyform=TRUE)
print(a)

```

rweyl	<i>Random weyl objects</i>
-------	----------------------------

Description

Creates random weyl objects: quick-and-dirty examples of Weyl algebra elements

Usage

```
rweyl(nterms = 3, vals = seq_len(nterms), dim = 3, powers = 0:2)
```

Arguments

nterms	Number of terms in output
vals	Values of coefficients
dim	Dimension of weyl object
powers	Set from which to sample the entries of the index matrix

Value

Returns a weyl object

Author(s)

Robin K. S. Hankin

Examples

```
rweyl()
rweyl(d=7)
```

weyl	<i>The algebra and weyl objects</i>
------	-------------------------------------

Description

Basic functions for weyl objects

Usage

```
weyl(M)
is.weyl(M)
as.weyl(val, d)
is.ok.weyl(M)
```

Arguments

M	A weyl or spray object
val, d	Value and dimension for weyl object

Details

Function `weyl()` is the formal creator method; `is.weyl()` tests for weyl objects and `is.ok.weyl()` checks for well-formed sprays. Function `as.weyl()` tries (but not very hard) to infer what the user intended and return the right thing.

Value

Return a weyl or a Boolean

Author(s)

Robin K. S. Hankin

Examples

```
(W <- spray(matrix(1:36,6,6),1:6))
weyl(W)

as.weyl(15,d=3)
```

weyl-class

Class "weyl"

Description

The formal S4 class for weyls.

Objects from the Class

Objects *can* be created by calls of the form `new("weyl", ...)` but this is not encouraged. Use functions `weyl()` or `as.weyl()` instead.

Author(s)

Robin K. S. Hankin

x_and_d

Generating elements for the first Weyl algebra

Description

Variables `x` and `d` correspond to operator x and ∂_x ; they are provided for convenience. These elements generate the one-dimensional Weyl algebra.

Note that a similar system for multivariate Weyl algebras is not desirable. We might want to consider the Weyl algebra generated by $\{x, y, z, \partial_x, \partial_y, \partial_z\}$ and correspondingly define R variables `x, y, z, dx, dy, dz`. But then variable `x` is ambiguous: is it a member of the first Weyl algebra or the third?

Usage

```
data(x_and_d)
```

Author(s)

Robin K. S. Hankin

Examples

```
d
x

.[d,x] # dx-xd==1

d^3 * x^4

(1-d*x*d)*(x^2-d^3)
```

zero

The zero operator

Description

The zero operator maps any function to the zero function (which maps anything to zero). To test for being zero, use `spray::is.zero()`; package idiom would be `is.zero()`.

Usage

```
zero(d)
```

Arguments

`d` Integer specifying dimensionality of the weyl object (twice the spray arity)

Value

A weyl object corresponding to the zero operator (or a Boolean for `is.zero()`)

Examples

```
(a <- rweyl(d=5))
is.zero(a)
is.zero(a-a)
is.zero(a*0)

a == a + zero(dim(a))
```
